pt. 1. Pachyrhizus to Rye. pt. 2. Sabadilla to Silica. pt. 3. Silk to Tea. pt. 4. Tectona to Zygophillum Springer Science & Business Media

What teachers do in the classroom is one of the most significant school-based factors in shaping student learning. Yet the classroom is often referred to as a 'black box' because there's so little we know about what actually happens there. This book provides insights into the 'black box' by describing and then comparing classroom practices in Malaysia's national public school system and that of a unique subsystem situated within it. Through analysis of hundreds of hours of classroom video data, as well as interviews, this book goes on to identify and discuss the forces that shape teachers' classroom practices from across the ecological system. What emerged were nuanced insights of how tightly and loosely coupled forces within the centralised Malaysian national

system shaped these teachers' classroom practices, that are illustrated in multiple case studies. Additionally, this volume uncovers micro-disruptions to some tightly-coupled forces within the system that could begin to change teachers' thinking about their classroom practice. These insights will be of interest to international and comparative education researchers, education policy makers and education professionals as well as anyone who has ever asked the question "Why do teachers do what they do in their classrooms?"

### **Nineteen Eighty-Four: Science Between Utopia and Dystopia**

Springer Science & Business Media  
Metrology is the science of measurements. As such, it deals with the problem of obtaining knowledge of physical reality through its quantifiable properties. The problems of measurement and of measurement accuracy are central to all natural and technical sciences. Now in its second edition, this monograph conveys the fundamental theory of measurement and provides some algorithms for result

testing and validation.

*Pt. 3, sections 1-2 of the imaginative and theoretic faculties* Hong Kong University Press

Just fifty years ago Julian Huxley, the biologist grandson of Thomas Henry Huxley, published a book which easily could be seen to represent the prevailing outlook among young scientists of the day: *If I were a Dictator* (1934). The outlook is optimistic, the tone playfully rational, the intent clear - allow science a free hand and through rational planning it could bring order out of the surrounding social chaos. He complained, however: At the moment, science is for most part either an intellectual luxury or the paid servant of capitalist industry or the nationalist state. When it and its results cannot be fitted into the existing framework, it and they are ignored; and furthermore the structure of scientific research is grossly lopsided, with over-emphasis on some kinds of science and partial or entire neglect of others. (pp. 83-84) All this the scientist dictator would set right. A new era of scientific humanism would provide alternative visions to the traditional religions with their Gods and the civic religions such as Nazism and fascism. Science in Huxley's version carries in it the twin impulses of the utopian imagination - Power and Order. Of course, it was exactly this vision of science which led that other grand son of Thomas Henry Huxley, the writer Aldous Huxley, to portray scientific discovery as potentially subversive and scientific practice as ultimately enslaving.

London : Library Association Pub.

The Encyclopaedia fills a gap in both the history of science and in cultural studies. Reference works on other cultures tend either to omit science completely or pay little attention to it, and those on the history of science almost always start with the Greeks, with perhaps a mention of the Islamic world as a translator of Greek scientific works. The purpose of

the Encyclopaedia is to bring together knowledge of many disparate fields in one place and to legitimize the study of other cultures' science. Our aim is not to claim the superiority of other cultures, but to engage in a mutual exchange of ideas. The Western academic divisions of science, technology, and medicine have been united in the Encyclopaedia because in ancient cultures these disciplines were connected. This work contributes to redressing the balance in the number of reference works devoted to the study of Western science, and encourages awareness of cultural diversity. The Encyclopaedia is the first compilation of this sort, and it is testimony both to the earlier Eurocentric view of academia as well as to the widened vision of today. There is nothing that crosses disciplinary and geographic boundaries, dealing with both scientific and philosophical issues, to the extent that this work does. xi PERSONAL NOTE FROM THE EDITOR Many years ago I taught African history at a secondary school in Central Africa.
