"A learner-centered approach means the book should recognize that all students come to this course with different goals and aspirations, different

backgrounds, different experiences, and different plans for learning. Accordingly, this textbook affirms that organic chemistry [and science in general] is for everyone, regardless of background, and that all are welcome and supported here. I wanted the book to happen the way a conversation about organic chemistry would happen, allowing for it to spin off organically [Ha!] in a variety of directions. The book is not intended to be a lecture from a podium to an unengaged audience. Instead, it is a lively discussion, a back and forth between student and text, the same kind of discussion that might occur in office hours, in the university cafeteria, while standing over a reaction in chemistry lab, or during a late-night review session"--

The modern aspiring astronomer is faced with a bewildering choice of commercially produced telescopes, including all the designs considered in the preceding chapter. Yet only four decades ago the choice for a small telescope would have been between just a refractor and a Newtonian reflector. That change has come about because of the enormous interest that has grown in astronomy since the start of the space age and with the mind-boggling discoveries of the past 30 or 40 years. Except for some of the very small instruments which are unfortunately often heavily promoted in general mail order catalogues, camera shops and the like, the optical quality of these commercially produced telescopes is almost uniformly excellent. Although one product may be slightly better for some types of observation, or more suited to the personal circumstances of the observer, than another, most of them will provide excellent observing opportunities. The same general praise cannot be applied, however, to the mountings with which many of these telescopes are provided, and those problems are covered in Chapter 6.
