*The Encyclopedia, Supplement 1*

University-Press.org

The study of dinosaurs has been experiencing a remarkable renaissance over the past few decades.

Scientific understanding of dinosaur anatomy, biology, and evolution has advanced to such a degree that paleontologists often know more about 100-million-year-old dinosaurs than many

species of living organisms. This book provides a contemporary review of dinosaur science intended for students, researchers, and dinosaur enthusiasts. It reviews the latest knowledge on dinosaur anatomy and phylogeny, how dinosaurs functioned as living animals, and the grand narrative of dinosaur evolution across the Mesozoic. A particular focus is on the fossil evidence and explicit methods that allow paleontologists to study dinosaurs in rigorous detail. Scientific knowledge of dinosaur biology and evolution is shifting fast, and this book aims to summarize current understanding of dinosaur science in a technical, but accessible, style,

supplemented with vivid photographs and illustrations. The Topics in Paleobiology Series is published in collaboration with the Palaeontological Association, and is edited by Professor Mike Benton, University of Bristol. Books in the series provide a summary of the current state of knowledge, a trusted route into the primary literature, and will act as pointers for future directions for research. As well as volumes on individual groups, the series will also deal with topics that have a cross-cutting relevance, such as the evolution of significant ecosystems, particular key times and events in the history of life, climate change, and the application of a new techniques such

as molecular palaeontology. The books are written by leading international experts and will be pitched at a level suitable for advanced undergraduates, postgraduates, and researchers in both the paleontological and biological sciences. Additional resources for this book can be found at:

**Dinosaurs 101** The Experiment Bigger and Better,

Updated and Expanded We live in a golden age of paleontological discovery—on average, we find one new dinosaur species per week. The most fascinating among them take their place in this updated edition of *Dinosaurs—The Grand Tour*; from *Aardonyx*, a lumbering beast that formed a link between two- and four-legged dinosaurs, to *Zuniceratops*, who boasted a deadly pair of horns. Here, you'll find everything worth knowing about every dinosaur worth knowing—more than 300 in all, including: *Amphibious Halszkaraptor* looks like no other dinosaur we've found—with a head and body the size of a duck's, sharp claws . . . and a swanlike neck. Longer

than a blue whale and three times taller than a giraffe, Patagotitan is a newly discovered contender for “biggest dinosaur ever.” The speedy little feathered predator *Stenonychosaurus* was an anatomical marvel, with retractable claws, asymmetrical ears for advanced hearing, incredible night vision, and a huge brain. *Oviraptor*—whose name means “egg thief”—doesn’t deserve its bad rap. This specimen from 1923 is now proven to have been sitting by its own eggs—not stealing another’s. *Sinornithosaurus* prove that dinosaurs shed their skin the same

way that humans do, rather than sloughing it off all at once like a snake. At-a-glance sidebars put each dinosaur’s diet, size, and location at your fingertips. Stories of harrowing expeditions conjure the thrills of history’s most famous dinosaur hunters. Highlights from recent research reveal what’s new in paleontology today, including scientists’ evolving idea of what dinosaurs actually looked like. (Hint: They were more colorful—and feathery!—than we ever thought before.) And illustrations on virtually every page bring these prehistoric creatures to life in all their glory.
