Occupational Safety and Hygiene presents selected papers from the International Symposium on Occupational Safety and Hygiene - SHO2013 (Guimarães, Portugal, 14-15

February 2013), which was organized by the Portuguese Society for Occupational Safety and Hygiene (SPOSHO). The contributions from 15 different countries focus on: - Occupational safety - Risk assessment - Safety management - Ergonomics - Management systems - Environmental ergonomics - Physical environments - Construction safety - Human factors The papers included in the book are mainly based on research carried out at universities and other research institutions, but they are also based on practical studies developed by Occupational Health & Safety (OHS) practitioners within their companies. As a result, this book will be useful to get acquainted with the state-of-the-art of the research within the aforementioned domains, as well as with some practical

tools and approaches that are currently used by OHS professionals worldwide. Toxicología clínica Academic Press Provides the means to identify and quantify drugs and other toxic substances in situations of overdose or poisoning and to interpret analytical results. Includes an analysis of toxic metals and pesticides.

Recortes do Brasil CRC Press Mercury (Hg) is a global pollutant that knows no environmental boundaries. Even the most stringent control of anthropogenic Hg sources will not eliminate exposure given its ubiquitous presence. Exposure to Hg occurs primarily via the food chain due to MeHg's accumulation in fish. Latest US statistics indicate that 46 States have fish consumption advisories. In addition,

Hg is a common pollutant in hazardous waste sites, with an estimated 3-4 million children living within one mile of at least one of the 1,300+ active hazardous waste sites in the US. The effects on intellectual function in children prenatally exposed to MeHg via maternal fish consumption have been the subject of two on-going major, prospective, longitudinal studies in the Seychelles and the Faroe Islands. It is important to recognize that the risk for MeHg exposure is not limited only to islanders with high fish consumption. This book will provide state-of-the-art information to the graduate student training in toxicology, risk assessors, researchers and medical providers at large. It is aimed to bring the reader up to date on contemporary issues

associated with exposure to methylmercury, from its effects on stem cells and neurons to population studies.

Aquaculture is rapidly becoming a major source of fish protein used to meet the nutritional needs of humans. As the aquaculture industry grows, exposure of farmed fish to environmental contaminants, and the need for chemical therapeutic agents for fish, will increase. This book is designed to bring together authorities worldwide on the regulation of environmental contaminants and food chemicals and researchers investigating the metabolism and disposition of foreign chemicals (xenobiotics) in fish species.

Carotenoids: Properties, Processing, and Applications fills the gap of transfer

knowledge between academia and industry, covering integral information in three critical dimensions: properties, recovery and applications. At the moment, carotenoid research is directed at particular applications, including colorants, antioxidants and recovery from plant processing by-products. These trends take into account the health, nutrition and functions of carotenoids, the new recovery efforts from underutilized sources, the extraction procedures using green solvents and technologies, and their sustainability aspects. Written by a team of experts in the field of food chemistry, food science and technology, as well as bioresource technologists mainly from academia, the book covers the most recent advances in the field of

carotenoids, while also analyzing the potential of already commercialized processes and products. Covers carotenoids' properties in view of alternative sources (plant by-products, microalgae, etc.), recovery technologies and applications Thoroughly explores mechanistic aspects, dietary intake and recommendations surrounding the health-promoting effects of carotenoids Discusses the effect of processing and storage conditions in carotenoid levels and bioavailability Presents applications and case studies in the food industry

The availability of various in vitro and in vivo techniques has considerably advanced the research on drug transport and metabolism across the blood-brain

barrier (BBB). These specialized and sophisticated experimental strategies are of fundamental importance if one is to gain a greater understanding of enhanced and selective drug delivery to the brain. The reader will find in this book methods for in vitro endothelial/astrocyte cell culture models, and for in vivo intracerebral microdialysis to study drug transport across the BBB. This book, however, is not merely a laboratory manual consisting of recipes for BBB research; it permits the presentation of the different methods in fine detail, revealing tricks and short cuts that frequently do not appear in the literature. The researcher is well aware that differences (subtle or otherwise) in experimental steps used in different laboratories may influence the

outcome of any particular procedure. The book also illustrates the accessibility and the application of the different methods in different species.

Background information of the protocol is given in every chapter, which also contains a literature list that the reader may wish to refer to for further information. This volume will be invaluable to basic researchers as well as to those involved in the search for agents suitable for pharmaceutical intervention in the central nervous system.

The area of food toxicology currently has a high profile of interest in the food industry, universities, and government agencies, and is certainly of great concern to consumers. There are many books which cover selected toxins in foods (such as plant toxins, mycotoxins, pesticides, or heavy metals), but this book represents the first pedagogic treatment of the entire range of toxic compounds found naturally in foods or introduced by industrial contamination or food processing methods. Featuring coverage of areas of vital concern to consumers, such as toxicological implications of food adulteration (as seen in ethylene glycol in wines or the

Spanish olive oil disaster) or pesticide residues, *Introduction to Food Toxicology* will be of interest to students in toxicology, environmental studies, and dietetics as well as anyone interested in food sources and public health issues. The number of students who are interested in toxicology has increased dramatically in the past several years. Issues related to toxic materials have received more and more attention from the public. The issues and potential problems are reported almost daily by the mass media, including television, newspapers, and magazines. Major misunderstandings and confusion raised by those reports are generally due to lack of basic knowledge about toxicology among consumers. This textbook provides the basic principles of food

toxicology in order to help the general public better understand the real problems of toxic materials in foods. Principles of toxicology Toxicities of chemicals found in foods Occurrence of natural toxins in plant and animal foodstuffs Food contamination caused by industry Toxic chemicals related to food processing Food additives Microbial toxins in foods

This volume contains the first complete

translations of Wilhelm Reich's writings from his Marxist period. Reich, who died in 1957, had a career with a single goal: to find ways of relieving human suffering. And the same curiosity and courage that led him from medical school to join the early pioneers of Freudian psychoanalysis, and then to some of the most controversial work of this century—his development of the

theory of the orgone—led him also, at one period of his life, to become a radical socialist. The renewed interest in Reich's Marxist writings, and particularly in his notions about sexual and political liberation, follows the radical critiques of Herbert Marcuse, Frantz Fanon and Paul Goodman, the political protest movements toward personal liberation in the present decade.
