New edition of a text on the applied science and clinical aspects of aviation medicine. Embracing all aspects of the field, 51 articles are divided into three parts: aviation physiology and aircrew systems, which takes the reader through the environmental hazards faced by aircrew, the physiological changes caused, and the effects of these changes; clinical aviation medicine (a systemic approach to medical disorders); and operational aviation medicine (applied physiological, psychological and clinical aspects of military and civil air operations). Edited by Ernsting (applied physiology, King's College London), Anthony N. Nicholson (aviation medicine, King's College), and

David J. Rainford (medical postgraduate dean and commandant, Royal Defence Medical College). Annotation copyrighted by Book News, Inc., Portland, OR

The story of one of history's greatest fighter aircraft from WWII to its remarkable restoration in 1980 Rhodesia: "an aviation classic-in-waiting" (Airscape). In 1977, the Rhodesian Air Force retrieved a World War II-era Supermarine Spitfire F Mk 22. But while the RAF was embroiled in the Bush War, the dream of restoring the aircraft was frustrated by international sanctions. That's when legendary pilot John "Jack" McVicar Malloch took control of the project. Not only had Jack flown Spitfires during World War II, he was also uniquely positioned to circumvent sanctions through his airfreight company, Air Trans Africa. With ingenuity, passion, and a team of trusted engineers, Jack realized the dream of putting Spitfire PK350 back in the air on March 29, 1980. In Malloch's Spitfire, author Nick Meikle tells the full story of this remarkable restoration and reveals some fascinating insights about the aircraft. The reader is

taken on a journey through the Spitfire's life, beginning with her first test flight in 1945. The project's lead engineer and many of the surviving pilots who flew her also share their memories. For two years, PK350 delighted those fortunate enough to see her fly. Then, on what was planned to be her last flight, Malloch's Spitfire never returned to base.

First published in 1971, these Guides provide invaluable information of thousands of maritime ports across the globe. They are compiled and published annually by LR One Ocean, whose years of global maritime experience allows them to provide expert and innovative solutions to the sector's problems. The Guides cover a significant geographical breadth, and the most recent volume includes information on over 12,500 ports, harbours and terminals worldwide. These are fully indexed and contain detailed port plans and mooring diagrams.

PLEASE NOTE: THIS IS VOLUME 1 OF 2. YOU MUST PURCHASE BOTH BOOKS TO HAVE A COMPLETE SET. Developed as both an air superiority fighter and a long-

range naval interceptor, Grumman's F-14 Tomcat was the U.S. Navy's primary fighter from 1974 until 2006. Over 700 were built. The F-14 flew its first combat missions shortly after its initial deployment in late 1974, flying in support of the American withdrawal from Saigon. In 1981 it drew first blood, as two F-14s from VF-41 downed two Libyan Su-22s. The plane compiled a notable combat record for the United States in both Gulf Wars and NATO actions in Bosnia. Planes sold to the Shah of Iran prior to his ouster remain the last F-14s in active service, as the U.S. Navy retired it in October 2006. This F-14 pilot's flight operating handbook was originally produced by the U.S. Navy. It has been slightly reformatted but is reproduced here in its entirety. It provides a fascinating view inside the cockpit of one of history's great planes.

This edition of this flight stability and controls guide features an unimposing math level, full coverage of terminology, and expanded discussions of classical to modern control theory and autopilot designs. Extensive examples, problems, and historical notes, make this concise

book a vital addition to the engineer's library.

In the early days of television, many of its actors, writers, producers and directors came from radio. This crossover endowed the American Radio Archives with a treasure trove of television documents. The collected scripts span more than 40 years of American television history, from live broadcasts of the 1940s to the late 1980s. They also cover the entire spectrum of television entertainment programming, including comedies, soap operas, dramas, westerns, and crime series. The archives cover nearly 1,200 programs represented by more than 6,000 individual scripts. Includes an index of personal names, program and episode titles and production companies, as well as a glossary of industry terms.

This book puts the reader in the pilot's seat for a "day at the office" unlike any other. The Smell of Kerosene tells the dramatic story of a NASA research pilot

who logged over 11,000 flight hours in more than 125 types of aircraft. Donald Mallick gives the reader fascinating first-hand description of his early naval flight training, carrier operations, and his research flying career with NASA. After transferring to the NASA Flight Research Center, Mallick became involved with projects that further pushed the boundaries of aerospace technology. These included the giant delta-winged XB-70 supersonic airplane, the wingless M2-F1 lifting body vehicle, and triple-sonic YF-12 Blackbird. Mallick also test flew the Lunar Landing Research Vehicle and helped develop techniques used in training astronauts to land on the Moon.

Human error is implicated in nearly all aviation accidents, yet most investigation and prevention programs are not designed around any theoretical framework of human error. Appropriate for all levels of expertise, the book provides the knowledge and tools required to conduct a human error analysis of accidents, regardless of operational setting (i.e. military, commercial, or general aviation). The book contains a complete description of the Human Factors Analysis and Classification System (HFACS), which incorporates James Reason's model of latent and active failures as a foundation. Widely disseminated among military and civilian organizations, HFACS encompasses all aspects of human error, including the conditions of operators and elements of supervisory and organizational failure. It attracts a very broad readership. Specifically, the book serves as the main textbook for a course in aviation accident investigation taught by one of the authors at the University of Illinois. This book will also be used in courses designed for military safety officers and flight surgeons in the U.S. Navy, Army and the Canadian Defense

Force, who currently utilize the HFACS system during aviation accident investigations. Additionally, the book has been incorporated into the popular workshop on accident analysis and prevention provided by the authors at several professional conferences worldwide. The book is also targeted for students attending Embry-Riddle Aeronautical University which has satellite campuses throughout the world and offers a course in human factors accident investigation for many of its majors. In addition, the book will be incorporated into courses offered by Transportation Safety International and the Southern California Safety Institute. Finally, this book serves as an excellent reference guide for many safety professionals and investigators already in the field.
