The Gezira Scheme is Sudan's oldest and largest gravity irrigation system. The scheme has played an important role in the economic development of the country, and is a major source of foreign exchange. The farming system of the Gezira Scheme is dominated by crop production. The main crops grown are sorghum, wheat, groundnut and the oilseed crop sesame. Sunflower (*Helianthus annuus* L.) is an important oil crop in the world and a new edible oil crop in Sudan. Knowledge of the effects of irrigation scheduling on sunflower production and water productivity under water stress conditions is becoming increasingly important. Irrigation scheduling is particularly important since many field crops are more sensitive to water deficit at specific phenological stages. Sunflower has several growth stages: emergence, vegetative, reproductive, flowering, seed formation and maturity. Water stress in each stage results in reduction in seed yield and oil content. The treatments in the test plots, which were conducted to study the effect of water stress at different growth stages, showed that sunflower was significantly affected by water stress that occurred in the sensitive flowering and seed formation stages. Highest seed yield was obtained when water stress was avoided during these stages. The AquaCrop model was used to simulate the seed yield and water productivity. The model was able to precisely simulate seed yield, but overestimated water productivity under different irrigation treatments.

The Impact of Six Deficit Irrigation Regimes on Yield, Grape, Wine and Sensory Components of Cabernet Sauvignon in 2012 and 2013 Springer
Issues in Agribusiness and Agricultural Economics: 2011 Edition is a ScholarlyEditions™ eBook that delivers timely, authoritative, and comprehensive information about Agribusiness and Agricultural Economics. The editors have built Issues in Agribusiness and Agricultural Economics: 2011 Edition on the vast information databases of ScholarlyNews.™ You can expect the information about Agribusiness and Agricultural Economics in this eBook to be deeper than what you can access anywhere else, as well as consistently reliable, authoritative, informed, and relevant. The content of Issues in Agribusiness and Agricultural Economics: 2011 Edition has been produced by the world's leading scientists, engineers, analysts, research institutions, and companies. All of the content is from peer-reviewed sources, and all of it is written, assembled, and edited by the editors at ScholarlyEditions™ and available exclusively from us. You now have a source you can cite with authority, confidence, and credibility. More information is available at <http://www.ScholarlyEditions.com/>.

Six different deficit irrigation regimes with four subsamples each were established in a commercial Cabernet Sauvignon vineyard (Dunnigan Hills AVA) in 2011. This study details the second and third vintage of the experiment (2012/13). Three treatments were maintained at constant leaf water potential targets, notably: a well-watered Control (CTL, -10 bars), the grower control (RHP, -13 bars) and a minimal irrigation (ED-, -14.5 bars). Two more "early deficit" treatments were switched at veraison, namely ED (-14.5/-11 bars) and ED+ (-14.5/>-10 bars). A "late" deficit featured stress exclusively post-veraison (-11/-14.5 bars). Differences in canopy development resulting from water availability were especially apparent in 2012, but the planned remote-sensing/canopy modeling by an academic cooperator did not deliver tangible results. Grapes were harvested when treatments reached a 24 Brix target and analyzed by our industry cooperator. Triplicate fermentations of each treatment were performed at the UC Davis Pilot Winery and resulting wines analyzed again as well as submitted to a full descriptive analysis sensory study. Seasonality presented an overriding effect, with 2012 expressing more extreme examples than 2013. Yields were reduced by up to 60% by deficit treatments in relation to their severity, but partially recovered with late season irrigation (ED+). As previously reported, the number of berries per cluster was a main contributing factor. Grape composition was affected primarily in its polyphenolic content, with increases in total tannin and non-tannin phenols of up to 20% with more extreme and more consistent deficits. ED+ effectively recovered overall yield, but did not significantly differ from the well-watered control with regards to composition. Moreover, ED+ exhibited slow late-season sugar accumulation paired with increasing pH-values. Pyrazines were only registered during the 2012 season and followed the well-documented pattern of number of buds/vine and early season canopy light environment, resulting in LD having the highest (49ppt) and ED+ having the absolute lowest values (18ppt). Wine compositions followed the composition observed in grape, with no apparent indications of extractability differences. Wine color presented the most apparent difference, with RHP, LD and ED- exhibiting greater intensity, but only LD showing a noticeably purple hue. Pyrazines were undetectable in wines. Descriptive Analysis training of 15 judges of diverse demographics produced 13 aroma- and 6 taste/mouthfeel attributes. When assessed by year, wines only differed significantly in astringency and "hot" mouthfeel (2012) or astringency and sour taste (2013), all of which clearly followed the concentrations established by the grape and wine analyses. When analyzing both vintages, a total of 9 attributes returned significant differences mostly driven by seasonality, thus insufficiently characterizing treatment effects other than astringency and alcohol. Future work, as currently already partially underway, should examine deficit irrigation effects across different cultivars while recording specific plant metabolomics measurements or whole-canopy modeling. The

quantification of individual anthocyanin- and polyphenol-species may prove helpful in determining extraction and color stabilization patterns. Given the recurrently negligible effect of yield and berry size, viticultural decisions should increasingly be driven by economical considerations supplemented by judgmental winemaking decisions to achieve the desired product.

Irrigation in Agroecosystems CRC Press

This new volume in the Innovations and Challenges in Micro Irrigation series covers an array of technologies to estimate evapotranspiration and to evaluate parameters that are needed in the management of micro irrigation, with worldwide applicability to irrigation management in agriculture. Topics include recent evapotranspiration research, performance evaluation of filters and emitters, evaluation of fertigation and ground water with treated wastewater effluent, performance of pulse drip irrigated potato under organic agriculture practices in sandy soils, impact of polyethylene mulch on micro irrigated cabbage, and tree injection irrigation.

Effect of Different Spacing and Irrigation Regimes on Spring Baby Corn (Zea Mays L.) [With CD Copy] John Wiley & Sons

This book was first published in 1983. It provides a comprehensive overview of irrigation technologies, techniques and economics, tailored to a multitude of different crops.

The book Irrigation Systems and Practices in Challenging Environments is divided into two interesting sections, with the first section titled Agricultural Water Productivity in Stressed Environments, which consists of nine chapters technically crafted by experts in their own right in their fields of expertise. Topics range from effects of irrigation on the physiology of plants, deficit irrigation practices and the genetic manipulation, to creating drought tolerant variety and a host of interesting topics to cater for the those interested in the plant water soil atmosphere relationships and agronomic practices relevant in many challenging environments, more so with the onslaught of global warming, climate change and the accompanying agro-meteorological impacts. The second section, with eight chapters, deals with systems of irrigation practices around the world, covering different climate zones apart from showing casing practices for sustainable irrigation practices and more efficient ways of conveying irrigation waters - the life blood of agriculture, undoubtedly the most important sector in the world.

Effect of Sulphur on Groundnut Under Different Irrigation Regimes IWMI

Globally stone fruits are emerging in the market due to the increased consumer's desire for health-promoting foods. Stone fruits attract research attention, mainly due to the cultural and commercial aspects of the array of varieties that are grown. Being grown in wide range of environments, it is very important to understand what factors influence the production and quality attributes of stone fruits. There is a lack of systematic scientific information on strategic approach for production technologies of such fruits. This book will be first of its kind focusing on technological aspects of stone fruits especially on latest developments in present day horticulture. It will be an essential reference for professionals including academicians, scholars, researchers and industries working in the said area. We hope that readers will find this book a useful resource for their research or studies, and it will be helpful in the development of high quality stone fruits in future which will improve the economic and social life of people. Besides, this book fulfills the needs of a number of horticultural courses of Universities and will serving as a pomological manual for all occasions.

Saffron is a precious spice which is mainly grown in Iran, India, Spain, Greece, Italy, Pakistan, Morocco, and central Asian countries. Until recently, saffron was perceived only for its value as a spice. However, with recent research findings pointing to the medicinal properties of saffron such as its antimicrobial, anticarcinogenic and antioxidan

Effect of Different Irrigation Regimes and Nitrogen Levels on the Growth, Water Relations, and Nutrient Concentration of 'Anjou' Pear Fruit and Leaves CRC Press

This book deals with a rapidly growing field aiming at producing food and energy in a sustainable way for humans and their children. It is a discipline that addresses current issues: climate change, increasing food and fuel prices, poor-nation starvation, rich-nation obesity, water pollution, soil erosion, fertility loss, pest control and biodiversity depletion. This series gathers review articles that analyze current agricultural issues and knowledge, then proposes alternative solutions.

Production and Processing John Wiley and Sons

A field experiment was conducted in sandy loam soil of Bidhan Chandra Krishi Viswavidyalaya, "C" Block Farm, Kalyani, Nadia, West Bengal, India during pre-kharif season of 2009 and 2010. The experiment was laid out in a split plot design having eight irrigation treatments in main plots and three sulphur treatments in sub-plot replicated thrice. The growth attributing characters, yield attributes, yield, yield parameters, the net return, benefit: cost ratio, and total uptake of nutrients (N, P, K and S) were significantly influenced by both the levels of irrigation and sulphur in most of the recording dates of observation during two consecutive years as well as pooled data. The higher values were recorded in three irrigations applied at flowering, pegging and pod filling stages (I8) along with sulphur applied @ 15 kg ha-1 (S2) treatment at all dates of recording observation during both the years of experimentation as well as pooled data. The highest CU and WUE were recorded in three irrigations applied at flowering, pegging and pod filling stages (I8) treatment and the lowest values were recorded in no irrigation (I1) treatment.

Issues in Food Production, Processing, and Preparation: 2013 Edition Frontiers Media SA

Irrigation, as the biggest water user in most regions of the world is facing significant challenges in balancing social, economic and environmental

needs for water. These proceedings of the 5th International Conference on Sustainable Irrigation and Drainage: Management, Technologies and Policies provide examples of how irrigation and drainage can become more sustainable, while acknowledging that the concept of sustainability is a goal that continues to change as our knowledge of the biophysical realities alters. In that sense moving towards sustainability is an ever evolving journey. A focus is made on the implications for improving sustainability, whether this is drainage, irrigation technologies, economic modelling, governance studies for irrigation management, reuse of water or any other aspect. Topics covered include: Irrigation management; Irrigation modelling; Irrigation systems and planning; Economic incentives; Groundwater issues; Water contamination and remediation; Drainage systems; Drainage modelling; International issues; Water reuse; Climate change effects; Water trade; Economics of irrigation; Socio-economic benefits.

Irrigation Systems and Practices in Challenging Environments CRC Press

An alfalfa (*Medicago sativa* L.) field study was established in 2011 at the University of Wyoming Research and Extension Center in Powell, WY. The objectives of the study were to determine: a) the daily and seasonal water use and the water use efficiency (WUE) of alfalfa grown under different irrigation regimes, b) the yield and quality response of alfalfa to limiting water, and c) to provide irrigation recommendations to Wyoming producers. The experiment was a strip plot with four irrigation treatments, including fully irrigated and 75%, 50% and 25% of fully irrigated, and three alfalfa cultivars with four replicates, including the cultivars Shaw, Mountaineer and Lander. Samples for growth analysis were obtained in an area of one m². Reference evapotranspiration (ET_{ref}) and crop coefficients (K_c) values were used to estimate the irrigation water amounts. A neutron probe, to a depth of 100 cm, was used to monitor soil moisture for water balance estimations based on the principles of conservation of mass. The WUE was estimated as the ratio of yield to crop evapotranspiration (ET_c). Significant differences (P

The Handbook of Irrigation System Selection for Semi-Arid Regions compares the various types of available irrigation systems for different regions and conditions, and explains how to analyze field data to determine the suitability of the land for surface, sprinkle, or drip irrigation systems. The book focuses on strategies for irrigation development and management and examines deficit irrigation and partial root-zone drying systems. Also, solute leaching modeling under different irrigation systems, soil moisture conditions, and organic fertilizer application in arid areas are discussed. Further, it examines multi-criteria decision making for irrigation management and the appraisal of agricultural lands for irrigation in hot, sub-humid regions. Features: Presents comparative analysis to aid in the selection of the most appropriate types of irrigation systems according to land characteristics. Includes numerous practical case studies. Offers parametric evaluation systems for irrigation purposes. Considers data from semi-arid zones, each with different sub-climates. Focusing on semi-arid land, the book highlights parametric evaluation systems for irrigation purposes, along with the use of analytical hierarchy processes integrated with GIS to determine which systems are best suited. This comprehensive and well-illustrated handbook will be of great interest to students, professionals, and researchers involved with all aspects of irrigation in semi-arid regions.

This book reviews the available information on bacterial disinfection in endodontics, with emphasis on the chemical treatment of root canals based on current understanding of the process of irrigation. It describes recent advances in knowledge of the chemistry associated with irrigants and delivery systems, which is of vital importance given that chemical intervention is now considered one of the most important measures in eliminating planktonic microbes and biofilms from the infected tooth. Recommendations are made regarding concentrations, exposure times and optimal sequences. Possible complications related to the use of the different solutions are highlighted, with guidance on response. In addition, clinical protocols are suggested on the basis of both clinical experience and the results of past and ongoing research. Throughout, a practical, clinically oriented approach is adopted that will assist the practitioner in ensuring successful endodontic treatment.

Chemical disinfection of the root canal system Springer Nature

Irrigated agriculture has been in a quandary of sustaining its productivity for centuries while attempting to cope with soil and water salinity issues that continue to devastate crop yields. Several of the research gaps associated with current irrigation methods include how to assess leaching requirements and efficiency for different soils, crops, and irrigation regimes. The objective of this project was to test water application methods on

salinity leaching efficacy. Three soils of different textures (clay, loam, and sandy soils) were collected from fields. The soils were air-dried and sieved (1.7 mm) and were used to pack the soil columns (10-cm dia. and 30-cm height) for the leaching experiments. Treatments of the column experiments included continuous ponding, intermittent ponding, and unsaturated water application with three replicates per treatment using the three soils. Furthermore, the HYDRUS 1D model was used to analyze the experimental data and to evaluate the leaching efficiency under different irrigation schemes. Our results showed that intermittent ponding was the most effective water application method for salinity leaching in the loamy soil, and that the unsaturated water application was the most effective water application method for salinity leaching in the clay soil by achieving 75% salt removal out of the columns using the least amount of water. The sandy soil had no difference in leaching efficiency among water application methods, therefore continuous ponding is recommended if time is not a limiting factor in water supply. The findings from this research will allow farmers to improve their water management practices and reduce groundwater contamination from excessive irrigation.

Handbook of Fruit and Vegetable Flavors WIT Press

Provides a comprehensive overview of the role of cotton in the economy and cotton production around the world This book offers a complete look at the world's largest fiber crop: cotton. It examines its effect on the global economy—its uses and products, harvesting and processing, as well as the major challenges and their solutions, recent trends, and modern technologies involved in worldwide production of cotton. Cotton Production presents recent developments achieved by major cotton producing regions around the world, including China, India, USA, Pakistan, Turkey and Europe, South America, Central Asia, and Australia. In addition to origin and history, it discusses the recent advances in management practices, as well as the agronomic challenges and the solutions in the major cotton producing areas of the world. Keeping a focus on global context, the book provides sufficient details regarding the management of cotton crops. These details are not limited to the choice of cultivar, soil management, fertilizer and water management, pest control, cotton harvesting, and processing. The first book to cover all aspects of cotton production in a global context Details the role of cotton in the economy, the uses and products of cotton, and its harvesting and processing Discusses the current state of cotton management practices and issues within and around the world's cotton producing areas Provides insight into the ways to improve cotton productivity in order to keep pace with the growing needs of an increasing population Cotton Production is an essential book for students taking courses in agronomy and cropping systems as well as a reference for agricultural advisors, extension specialists, and professionals throughout the industry.

Management, Technologies and Policies Springer

Acting as chemical messengers for olfactory cells, food flavor materials are organic compounds that give off a strong, typically pleasant smells. Handbook of Fruit and Vegetable Flavors explores the flavor science and technology of fruits and vegetables, spices, and oils by first introducing specific flavors and their commercialization, then detailing the technical aspects, including biology, biotechnology, chemistry, physiochemistry, processing, analysis, extraction, commodities, and requirements for application as food additives. With chapter authors representing more than ten different countries, this handy reference provides a comprehensive view of this evolving science.
