This atlas is unique in comparing the two disciplines of dental implant surgery and tooth-preserving surgery with respect to common procedures, problems, and failures and in providing excellent guidance on the prevention and management of complications. The etiology of a wide variety of implant-related and non-implant-related complications and failures is carefully explained. Since many complications have their roots in oral and periodontal surgical maneuvers, these maneuvers are themselves discussed and extensively illustrated. The most frequently used tooth preservation procedures are also fully described, with emphasis on correct surgical technique as a means to avoid complications. The use of these procedures is constantly weighed against the effects of tooth removal and insertion of dental implants. The text is complemented by the inclusion of a substantial number of helpful references. While the atlas is intended primarily for dentists involved in outpatient implant dentistry and oral surgery, oral and maxillofacial surgeons will also find the descriptions of innovative techniques or maneuvers to be of interest, including those relating to the selection of incision and flap design and the sinus floor elevation techniques.

A Colour Atlas of Forensic Dentistry Thieme

Today, for patients of any age, a panoramic radiograph that allows high diagnostic reliability with minimum radiation exposure must be acknowledged as the standard of care. The new, more medically and legally responsible strategy for examination of patients is closely intertwined with a basic principle of patient care. Panoramic radiograph is rapidly becoming a meaningful and normal component of dental practice-oriented prevention. This Atlas presents the proper use of optimum radiographic exposure and contemporary techniques for today's dental office. Emphasis is placed on the reliable recognition of normal structures in the projected space and clear differentiation of

normal features from pathological radiographic signs. These major topics of fundamental importance for correct interpretation are treated more extensively. The section on diagnosis deals in depth with the typical radiographic manifestations of frequently occurring pathological processes. Inherent in that section of the book is the basic understanding that the radiopathologic manifestation of one and the same lesion may vary considerably depending on the patient's age and sex, on the phase of development of the lesion at the time of documentation, on the localization within different surrounding structures, and according to actual histologic features of the lesion.
