Balance Charts A fluid
balance chart is used to
document a patient's fluid
input and output within a
24-hour period. This
information is used to
inform clinical decisions
(such as medication and
surgical interventions)
from medical staff, nurses

and dieticians, who all expect accurate figures in exact measurements (Georgiades 2016). Fluid Balance Charts, Hypervolaemia & Hypovolaemia | Ausmed Below is an example of a daily fluid balance chart showing some of the possible fluid inputs and outputs that may be recorded (click the image to enlarge). The nurses cannot record insensible losses, however bear in mind a 'healthy' patient will lose approximately 800-1000ml (See

Physiology : Fluid balance in health to revise this). The example fluid balance chart states insensible losses as 800ml of 'evaporation' to help remind nurses to include this in their total fluid balance ... Fluid balance chart - Fluids Tutorial The use of fluid balance charts that show cumulative input and output is now being debated in the literature (Bennett, 2010). A recent study by Perren et al (2011) suggested that for a large proportion of patients, especially those in critical care,

cumulative fluid balance charts are not accurate and their use should be questioned. Measuring and managing fluid balance | Nursing Times The fluid balance chart has been a document in the healthcare system for over 50 years and is a non-invasive tool to assess the hydration status of patients.
