A thorough appreciation of the cellular, molecular and tissue changes which precede the birth of an animal is a fundamental requirement for understanding normal structural development and also abnormal processes which result in congenital defects. This textbook provides information relevant to many subjects taught in preclinical, paraclinical and clinical years. Early chapters describe and explain sequential events relating to the division, growth and differentiation of cells and to the formation of foetal membranes, implantation and placentation. Succeeding chapters trace the origin, growth, development and maturation of the major body systems. Age determination of the embryo and foetus is reviewed in a single chapter. Genetic, chromosomal and environmental factors which adversely affect pre-natal development are reviewed in the final chapter. A reading list at the end of

each chapter offers additional sources of information on the topics discussed. Tables, flow diagrams and numerous hand-drawn illustrations provide information in a form which complements the concepts presented in the text. Key features: Written by a team which includes members with expertise in developmental anatomy, molecular biology and clinical aspects of veterinary medicine. The authors have extensive experience in the teaching of veterinary embryology and cognate subjects. Illustrations, hand-drawn by a veterinary graduate, are used extensively to explain organogenesis and system development. An explanatory glossary provides concise information on specialised terms used in the text. The index is designed for easy retrieval of information.

This book discusses how to deal ethically with people with Fetal Alcohol Spectrum Disorder (FASD) in the police, courts and correctional services. Ethical and legal issues associated with the deficits of individuals with a brain disorders such as FASD are surfacing more and more frequently in criminal proceedings. People with FASD often have not been diagnosed and rarely exhibit any visible evidence of the disorder. It has been argued that this invisible disability puts them in a disadvantaged position in the justice system, since the awareness of this condition is limited. The need to identify and to address FASD more effectively and the many ethical issues this raises within the context of the law is increasingly acknowledged within judicial and legislative branches, as well as in government departments, agencies and community programs that provide services to those with FASD and their caretakers and families. This is the first book to give to elaborate on ethical and legal issues of FASD.

This comprehensive atlas is unique in combining information on the embryological development of the human with detailed presentation of the congenital malformations encountered in clinical practice. As a consequence it will not only assist practitioners and trainees in recognizing and evaluating malformations, but also enable them to understand how a malformation has developed and to explain the mystery of congenital malformations to relatives and patients. The book is organized according to anatomic region, with additional chapters on hernias, tumors, lymphogenesis and lymphatic malformations. According to WHO statistics, each year congenital anomalies result in approximately 3.2 million birth defect-related disabilities worldwide. All too often, however, training in embryology is now a neglected area, and medical graduates frequently lack confidence in their knowledge of the field. *Clinical Embryology: An Atlas of Congenital Malformations* will help to rectify this deficit and to ensure that malformations are comprehended and managed appropriately. It will

be of value for postgraduate trainees in pediatric surgery, pediatrics, and neonatology, undergraduate medical students, and general practitioners/family physicians.

A bold affirmation that we are sentient before conception and in the womb, *The Secret Life of Babies* reveals author Mia Kalef's groundbreaking findings: babies are able to remember their earliest experiences, this consciousness precedes the physical development of the brain itself, and medical interventions during birth—like forceps and Cesareans—can imprint our relationships with the world and disconnect us from our sustainable place in the ecosystem. Kalef provides a six-step protocol for detecting these individual imprints and taking reparative steps for physiological and emotional balance and release. This book offers us an articulate guide to a transformation that can restore our essential nature. This comprehensive, illustrated guide presents representative general surgery, including gastrointestinal tract, hepatobiliary and inguinal hernia. Surgery is generally based on the microanatomy; however, in practice surgery involves more dynamic and floating anatomy. In the last decade, the methods have been constantly improved, shedding new light on classical anatomical science. Laparoscopic is one such methodology. All illustrations presented in this book have been drawn by the author – a pioneering surgeon – and show real-world procedures. All the methods introduced are practical and have been refined based on the precise clinical and embryological anatomy.
