A change is coming. By 2050, the world's 65-and-older population will double, and the 85 and older population will mushroom fivefold. As the number of older adults surge, so too will the number of medication management challenges pharmacists and other health care providers experience. For the geriatric population, complex cases are often the norm, and providing safe and effective care can mean considering assessments of function and cognition, contacting multiple prescribers, and understanding a patient's history, beliefs, and care giving situation before making therapeutic decisions. *Fundamentals of Geriatric Pharmacotherapy: An Evidence-Based Approach* gives practitioners the information they need to improve outcomes and personalize care for elderly patients. Section 1 explores important foundational concepts such as social and behavioral issues, ethical considerations, biomedical principles of aging, geriatric assessment, and polypharmacy. Section 2 covers common disease states in aging adults, providing evidence-based treatment information as well as helpful tips for minimizing common problems and contending with clinical controversies.

Particular attention is given to how treatment can differ along the spectrum of active elderly to frail elderly patients. Useful features throughout the book guide practitioners in navigating the maze of information required when caring for an older patient. These include: Summarized treatment guidelines Reviews of the evidence-base Special focus on recommendations for frail elderly At least one full case study, or more, in each chapter Clinical Pearls Key Points highlight important information in each chapter Key terms and definitions The demands of an aging population mean a greater understanding of geriatric pharmacotherapy will soon be essential for all health care providers. *Fundamentals of Geriatric Pharmacotherapy* ensures that you'll have the information needed to respond appropriately

A practical guide to the principles and methods of cost analysis as a managerial tool for improving the efficiency of hospitals. Addressed to managers and administrators, the manual aims to

equip its readers with the knowledge and skills needed to calculate the costs of different activities or departments, analyse their significance, and use this information to manage resources wisely. Throughout, recommendations and advice are specific to the different purposes of cost analysis and the different types of decisions commonly facing managers. The manual, which is intended for use as a training tool, was finalized following extensive field testing in workshops in Bangladesh, Egypt, and Zimbabwe. Methods of cost-finding and cost analysis are thoroughly explained and illustrated with practical examples and model step-by-step procedures for performing calculations. Since hospital accounting systems in developing countries may have gaps or inaccuracies, the manual gives particular attention to reliable methods for estimating costs when existing data are problematic. The manual opens with an explanation of the many advantages of using cost-finding and cost analysis as managerial tools. These include the provision of data needed for informed decisions on operations and infrastructure investment, the planning of future budgets, the establishment of charges for patient services, and the development of mechanisms for ensuring that costs do not exceed available revenues and subsidies. Against this background, the core of the manual is presented in three chapters. The first and most extensive chapter explains how to allocate costs to cost centres and how to compute unit costs. Information and examples are presented according to seven steps. Each is discussed in terms of the types of data needed, how component cost items should be treated, and how costs can be computed in particular situations or cases. Practical examples are used to illustrate the types of questions addressed in cost analysis and the value of this information in guiding decisions. Chapter two explains how cost data can be used to improve the management of an individual hospital. Information is intended to guide decisions at both the cost centre, or department, level and the hospital level. Managerial tasks covered include budgeting, profitability, efficiency improvements, contracting outside services or producing in-house, and assessing fiscal solvency. Chapter three considers the use of cost data in managing national and regional hospital systems. Specific applications include improvements in the referral system, the appropriate use of different providers of services, and the comparison of similar hospitals to identify inefficiencies or sources of waste. The manual concludes with a series of practical exercises, followed by explanations of their answers.

The medical tradition that developed in the lands of Islam during the medieval period (c. 650-1500) has, like few others, influenced

the fates and fortunes of countless human beings. It is the story of contact and cultural exchange across countries and creeds, affecting caliphs, kings, courtiers, courtesans, and the common crowd. In addition to being fascinating in its own right, it formed the roots from which modern Western medicine arose. Contrary to the stereotypical picture, medieval Islamic medicine was not simply a conduit for Greek ideas, but was a locus for innovation and change. The book is organised around five topics: the emergence of medieval Islamic medicine and its intense cross-pollination with other cultures, the theoretical medical framework, the function of physicians within the larger society, the medical care as seen through preserved case histories, and the role of magic and devout religious invocations in scholarly as well as everyday medicine. A concluding chapter on the 'afterlife' concerns the impact of medieval Islamic medicine upon the European medical tradition and its continued practice today. The aim of this book is not to compress the entire history of medieval Islamic medicine into a single small volume. Rather, it presents an overview, highlighted with particular examples.

We organize things. We organize information, information about things, and information about information. Organizing is a fundamental issue in many professional fields, but these fields have only limited agreement in how they approach problems of organizing and in what they seek as their solutions. The Discipline of Organizing synthesizes insights from library science, information science, computer science, cognitive science, systems analysis, business, and other disciplines to create an Organizing System for understanding organizing. This framework is robust and forward-looking, enabling effective sharing of insights and design patterns between disciplines that weren't possible before. The 4th edition of this award-winning and widely adopted text adds content to bridge between the foundations of organizing systems and the new statistical and computational techniques of data science because at its core, data science is about how resources are described and organized. The 4th edition reframes descriptive statistics as organizing techniques, expands the treatment of classification to include computational methods, and incorporates many new examples of data-driven resource selection, organization, maintenance, and personalization. The Informatics edition contains all the new content related to data science, but omits the discipline-specific content about library science, museums, and document archives.
