Rehabilitation practitioners face the difficult task of helping clients adjust to chronic illness or disability. This can be a long and trying process for both practitioner and client. With this handbook, however, practitioners and students can gain a wealth of insight into the critical issues clients face daily. This book presents the dominant theories, models, and evidence-based techniques necessary to help the psychosocial adjustment of chronically ill or disabled persons. Each chapter is written from an evidence-based practice (EBP) perspective, and explores how important issues (i.e., social stigma, social support, sexuality, family, depression, and substance abuse) affect persons adjusting to chronic illness and disability. Key features include: A review of psychopharmacological treatment options for depression, anxiety, and other disorders coinciding with rehabilitation The effect of rehabilitation on the family, including key family intervention strategies Strategies for using positive psychology and motivational interviewing in rehabilitation Multiculturalism and the effect of culture on the adjustment process Ancillary materials including an instructor's manual with a syllabus, examination items, PowerPoint presentation, and answers to class exercises By incorporating research-based knowledge into clinical rehabilitation practice, health care professionals can ensure that people with chronic illness and disability receive only the best treatment.

The book provides an accessible introduction to many of the current theoretical perspectives on disability; enabling readers to challenge the taken-for-granted nature of traditional knowledge and assumptions within the rehabilitation, health and community care industries, and encouraging a more critical approach both to the nature of rehabilitation following injury or illness and to the 'problem' of physical difference and

disability. Through its interrogation and exploration of new theoretical perspectives on disability and rehabilitation, this book provides a unique text for students and practitioners of nursing, occupational therapy, physiotherapy and social work and for educators and researchers in these fields. Although rehabilitation practitioners claim to aspire to client-centred practice and advocate participatory modes of research, rehabilitation theory remains curiously estranged both from theoretical perspectives developed by disabled/disability theorists and from critical perspectives on 'disability' that are emerging from other academic disciplines. Thus immune from alternate views, rehabilitation practitioners fail to question the premise that their professional assumptions are correct or 'right'. Contemporary theorists raise important questions, for example, about professional power, concepts of normality, independence and the physical body - issues central to rehabilitation - as well as to the role of the cultural environment in producing prejudice, the role of the social environment in creating disadvantage; and to issues of power and privilege and of the systemic oppression of disabled people. This book provides an introduction to the expanding body of critical work on disability by theorists from a range of perspectives, illustrating ways in which their theories and insights contest or support assumptions within rehabilitation theory. The book argues for a cross-fertilisation of ideas and challenges hierarchies of power in which nurses and therapists privilege their own assumptions, perspectives and knowledge while overlooking or ignoring the perspectives both of disabled people and of other theorists. - Provides an accessible introduction to current theoretical perspectives on disability - Demonstrates how these theoretical perspectives can inform a practitioner's approach to rehabilitation - Relevant for all the rehabilitation and health care professions

Teaching Evidence-Based Practice in Nursing IGI Global

This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation.

Consequences of diseases, e.g. impairments and activity limitations, are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation bridging the gap between clinical evidence and clinical decision-making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors, as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic, but concise review of the evidence (RCTs, systematic reviews and meta-analyses) that is relevant for clinical decision-making, and comments on assessment, therapy (training, technology, medication), and the use of technical aids as appropriate. Based on these summaries, clinical algorithms / pathways are provided and the main clinical-decision situations are portrayed. The book is invaluable for all neurorehabilitation team members, clinicians, nurses, and therapists in neurology, physical medicine and rehabilitation, and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative, bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision-making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives.

Evidence-Based Practice in Clinical Social Work Saunders

This scholarly book focuses on stroke in Africa. Stroke is a leading cause of disability among adults of all ages, contributing significantly to health care costs related to long term implications, particularly if rehabilitation is sub-optimal. Given the burden of stroke in Africa, there is a need for a book that focuses on functioning African stroke survivors and the implications for rehabilitation within the African context. In addition, there is a need to progress with contextualised, person-centred, evidence-based guidance for the rehabilitation of people with stroke in Africa, thereby enabling them to lead socially and economically meaningful lives. The research incorporated in the book used a range of primary and secondary methodological approaches (scoping reviews, systematic reviews, meta-analyses, descriptive studies, surveys, health economics, and clinical practice guideline methodology) to shed new insights into African-centred issues and strategies to optimise function post-stroke.

Wound Healing CRC Press
