Until the 70s and 80s anthropologists studying different cultures had mainly confined themselves to the behaviour and idea systems of adults. Psychologists, on the other hand, working mainly in Europe and America, had studied child development in their own settings and simply assumed the universality of their findings. Thus both disciplines had largely ignored a crucial problem area: the way in which children from birth onwards learn to become competent members of their culture. This process, which has been called 'the quintessential human adaptation', constitutes the theme of this volume, originally published in 1988. It derives from a workshop held at the London School of Economics which brought together fieldworkers who in their studies had paid more than usual attention to children in their cultures. Their experience and foci of interest were varied but this very diversity serves to illuminate different facets of the acquisition of culture by children, ranging in age from pre-verbal infants to adolescents. Evolutionarily primed for culture-learning, children are responsive to a rich web of influences from subtle and indirect as in their music and dance to direct teaching in the family guided by culture-specific ideas about child psychology. Some of the salient things they learn relate to gender, status and power, critical for the functioning of all societies. The introductory essay provides the necessary historical background of the development of child study in both anthropology and psychology and outlined how future research in the ethnography of childhood should proceed. The book concludes with an annotated bibliography providing a guide to the literature from 1970 onwards.

Describing and Transforming Cultures Oxford University Press

This book considers cultural psychology from historical, theoretical, and epistemological perspectives, building an understanding of cultural psychology as a human science and moving beyond the nature-culture dichotomy. The unique collection of chapters seeks to advance the field of cultural psychology by reviving its historical legacies and arguing for its social responsibility in future historical developments. It considers European legacies for cultural psychology as developed by leading figures such as Giambattista Vico, Wilhelm Wundt, Wilhelm Dilthey, and Ernst Cassirer in order to provide insights into a long tradition of thinking from a cultural psychology perspective. The book discusses historical pathways in the rise and repression of cultural psychology and its different historical forms, arguing for the necessity of decolonizing psychology, securing a place for culture in it, and developing an epistemology suited to humankind's meaning-making processes in mutual shaping of psyche and culture. It provides an integrative and historical understanding of the subject and uses the diversity and heterogeneity within the field to offer critical reflections on its achievements. The thoroughly international group of contributors brings diverse analyses of self, body, emotions, culture, and society and considers the future of cultural psychology. The volume is a stimulating read for scholars and students of cultural and theoretical psychology and related areas including philosophy, anthropology, and history.

Methods and Assessment in Culture and Psychology SAGE

This is the first book that provides detailed guidelines of how to conduct multi-disciplinary research to study people's behaviors in different cultures. Readers are encouraged to look beyond disciplinary boundaries to address issues between individuals and their socio-cultural environments so as to design the most effective studies possible. The core philosophical and theoretical assumptions that underlie the strategies, designs, and techniques used when researching cultural issues are examined. The book reviews all the steps that go into doing cultural research from formulating the research problem to selecting the most appropriate method for data analysis. Realist and interpretivist paradigms together with the theory of cultural models and quantitative, qualitative, mixed-method, and multiple-design strategies are reviewed. Case studies, ethnographies, and interviewing techniques are emphasized throughout. Chapters open with learning objectives and end with a conclusion, a glossary, questions, exercises, and recommended readings. Numerous multidisciplinary examples, tables, and figures demonstrate and synthesize the analysis of data. Information boxes provide historical notes and how-to boxes provide tips on methodological issues. Highlights include: -Encourages researchers to breach disciplinary boundaries to address the problems of human functioning in different cultures (Chs. 1 & 2). -Introduces readers to the theory of cultural models that helps bridge the human mind and socio-cultural realities (Chs. 2 & 10). - Propagates the realist and interpretivist philosophical paradigms for doing cultural studies and demonstrates how to use these approaches when studying people in different cultures (Chs. 3 & 4). - Helps readers formulate productive research questions, articulate concepts, and understand the role theories play in cultural research (Ch. 5 - 6). -Reviews research designs including case-based and

variable-based ones, person-centered ethnography, interviewing, and quantitative studies (Chs. 7 - 10). -www.routledge.com/9780415820325/ provides instructors with Power Points, additional references and studies, and questions for discussion and evaluation for each chapter and students with chapter outlines and objectives, key terms and concepts with a hotlink to the definition, and suggested readings and websites. Part 1 explores disciplinary and theoretical thinking to help readers connect different disciplines, theories, and philosophical paradigms in a logical way. Part 2 reviews planning research with an emphasis on defining the research problem. Here readers learn to articulate the purpose of the study and the research questions, work with related conceptual and theoretical foundations, and identify various research strategies including nomothetic and idiographic approaches, variable- and case-based studies, and potential sampling problems. Part 3 reviews the practical aspects of doing cultural research -- how to use various research designs including experimental, quasi-experimental, correlational studies, mixed method designs, and ethnographic and qualitative studies. Methodological problems specific to researching cultural issues such as the equivalence of concepts, the translation of instruments, and verifying measurement invariance are reviewed. Readers are also introduced to ethnography including practical elements such as language training, formal document requirements, and issues related to working in an unfamiliar community. The book concludes with the most crucial aspects of conducting ethical cultural psychological research. Intended for advanced undergraduate or graduate courses that conduct cultural or cross-cultural research including cross-(cultural) psychology, culture and psychology, or research methods/design courses in psychology, anthropology, sociology, cultural studies, social work, education, geography, international relations, business, nursing, public health, and communication, the book also appeals to researchers interested in conducting cross-cultural and cultural studies. Significant advancements in methodologies and statistical techniques in cross-cultural psychological research abound, but general practice, education, and most researchers in psychology rarely use them. This leads to misinterpretations, misrepresentations, and prejudice. The authors expertly demonstrate the importance of methodological rigor to safeguard appropriate inferences about similarities and differences, particularly when methods have not been developed in the cultural contexts where they are used. The book features acculturation and identity, including contributions on remote acculturation, religiosity, and organizational contexts. It also covers individual differences and evaluates methodological progress in educational assessment, emotions, motivation, and personality. Methodological and psychometric perspectives on equivalence and bias, as well as measurement invariance in cross-cultural research, are a central theme. From study design to data interpretation, it is essential for psychology, and the social sciences in general, to adopt methods and assessment procedures that are more rigorous for culture-comparative studies.

Cross-cultural contacts are now commonplace. In schools, neighborhoods, and businesses cultural diversity is now the rule, not the exception. And, as this contact increases, it raises several important--and fundamental--questions. How valid are our self-perceptions in relation to other cultures? How receptive are we to the viewpoints of other cultures? Indeed, are differences necessarily detriments? In *Applied Cross-Cultural Psychology*, a distinguished international team of experts examines the many facets of the cross-cultural experience, including cross-cultural testing and assessment, the psychological effects of acculturation, the role of foreign students, industrial and organizational psychology, acculturation and emotional and physical health, and cross-cultural orientation programs. Specific methodologies and how they may be applied in different areas, the emphasis on basics rather than complex theoretical issues, and the development of current knowledge and review of concepts make this innovative book appealing to professors, undergraduate students, and practitioners alike. A must read for anyone with interests in cross-cultural comparative studies, psychology, social psychology, counseling, social work, organization studies, and sociology. "The coverage of topics in this book, in terms of breadth as well as depth, is quite impressive. In the introductory chapter, the editor, Richard Brislin, does an excellent job of drawing together the rather diverse chapters of the volume. In fact, his chapter could easily serve as a very up-to-date summary of the social-personality-clinical components of cross-cultural psychology . . . Overall, this volume represents an important early effort to outline the potential contributions of a cross-cultural orientation to the resolution of social problems. Indeed, there are remarkably few areas in "mainstream" applied psychology that are not covered in this book . . . the volume is very successful. the authors are to be commended for providing a broad look into terribly important and interesting issues in a manner that is palatable to specialist and generalist alike." --*Journal of Cross-Cultural Psychology* "For everybody who wants to become (more) familiar with the cross-cultural psychological approach to diversity, this book will be very useful." --*International Association for Intercultural Education* "An extraordinarily coherent and well-edited volume of chapters that spans a very wide range of theoretical and applied models of psychology. . . . There is a chapter on cross-cultural psychology and the programmes: on international students; on family and home-based interventions; on acculturation; on the environment, culture and behaviour; and more besides. If these topics whet your appetite, then this is the volume for you." --*Behaviour Research Therapy*

Where Culture and Mind Meet Cambridge University Press

Cross-Cultural Psychology: Why Culture Matters addresses both established and very recent research in cultural and comparative cross-cultural psychology. The book is written by Professor Krum Krumov of Sofia University in Bulgaria and Professor Knud S. Larsen from Oregon State University. The authors are long-term colleagues with extensive research experience in cultural, cross-cultural and international settings. The book starts with a discussion of the tentative nature of cultural information given the forces of globalization and communication integration. Weighing these issues still permits for some powerful conclusions about differences that matter as well as human universals based on our communalities. The reader is also provided with a through grounding in relevant research approaches and critical thinking that provides the basis for an evaluation of the research literature. Further, the book reports on what we know about the origin of culture, especially the forces of cultural transmission and the evidence for socio-cultural evolution. The impact of culture and psychology on human development is contrasted and evaluated. A chapter on language stresses the importance of evolutionary forces and the relationship to socio-culture. In turn that discussion sets the stage for reporting the relevant research on cognition that yields information on the impact of genetics, but also the affect of cultural evolution. A distinct contribution is the evaluation of human happiness and emotions. The book demonstrates tangible relationships to both the universal expressions of emotions, but also the impact of cultural values on well-being. A consideration of personality theory follows in the systematic and progressive discourse in the book. Research is reported on Western, Eastern and Indigenous conceptualizations and research approaches. The discussion on the self is considered next and the authors evaluate cultural, social and comparative cross-cultural dimensions. Finally, a discussion of sex and gender follows as associated with salient cross-cultural dimensions. The book concludes with a discussion of the affect of cultural values in organizational behavior and a consideration of the relationship between culture and human health.

The methods discussed include various interview methodologies, digital tools, use of media representations, exposure to positive exemplars, survey and experience sampling, and participatory action research. These topics and methods are arranged across three sections: methods that are meant to describe culture and cultural phenomena, methodologies designed to facilitate awareness of structural bias and inequity, and a section on broad, overarching issues, such as the colonial harm inflicted by scientific research, diversity in open science, and intersectionality.

Culture and Psychology Taylor & Francis

Cross-cultural psychology has come of age as a scientific discipline, but how has it developed? The field has moved from exploratory studies, in which researchers were mainly interested in finding differences in psychological functioning without any clear expectation, to detailed hypothesis tests of theories of cross-cultural differences. This book takes stock of the large number of empirical studies conducted over the last decades to evaluate the current state of the field. Specialists from various domains provide an overview of their area, linking it to the fundamental questions of cross-cultural psychology such as how individuals and their cultures are linked, how the link evolves during development, and what the methodological challenges of the field are. This book will appeal to academic researchers and post-graduates interested in cross-cultural research.
