Scientific Essay from the year 2021 in the subject Business economics - Accounting and Taxes, , language: English, abstract: Hardly any other cost accounting method is as versatile and universally applicable as contribution margin accounting. From simple production program decisions to transport optimization or high-bay warehouse planning, there are numerous possible applications. The counterpart to direct costing is absorption costing - absorption costing is suitable for small and medium-sized companies, for companies with a small or no cost accounting system. In general, both cost accounting systems should have a smaller cost center accounting - because the full cost accounting allocates the entire costs (as the name already indicates: full costs) - to the cost objects (= products / = services) - for this you need the cost centers to allocate / allocate the entire costs of the company to the cost objects. That is, the cost objects are the bearers of the costs, because the costs are raised for them, because they are the end products that the company offers to the market / end consumer and therefore these end products / cost objects must also recover these full costs / total costs through the sales price to the end consumer (including

a profit margin) (Coenenberg et al., 2016).

Cost Accounting Fundamentals John Wiley & Sons
Management and cost accounting has been the basic toolbox in business administration for decades. Today it is an integral part of all curricula in business education and no student can afford not to be familiar with its basic concepts and instruments. At the same time, business in general, and management accounting in particular, is becoming more and more international. English clearly has evolved as the "lingua franca" of international business. Academics, students as well as practitioners exchange their views and ideas, discuss concepts and communicate with each other in English. This is certainly also true for cost accounting and management accounting. Management Accounting is becoming increasingly international. "Management and Cost Accounting" is a new English language

textbook covering concepts and instruments of cost and management accounting at an introductory level (Bachelor, but also suited for MBA courses due to strong focus on practical applications and cases). This textbook covers all topics that are relevant in management accounting in business organizations and that are typically covered in German and Central European Bachelor classes on cost accounting and management accounting. After an introduction to the topic, including major differences between the German approach and the purely Anglo-Saxon approach of management accounting, the book describes different cost terms and concepts applied in German cost accounting. The book is much more specific here compared to US-American standard textbooks. Based on different cost concepts, the topic of cost behavior is discussed, including the determination of cost functions. The heart of the book guides the reader through the general structure of a fully developed cost accounting system following the German and Central European standard: It starts with cost type accounting, moves on to cost center accounting and finally deals with cost unit accounting, assigning cost to goods and services offered in the market. The remaining parts of the book deal with decision making and how management and cost accounting data can support managers in this task. A comparison of absorption costing and variable costing introduces the reader to management decisions such as product portfolio and outsourcing decisions. Additionally, cost-volume-profit analysis (break-even-analysis) is covered. The book closes with a comprehensive treatment of cost planning and variance analysis.

This book addresses an important issue -- the nature of and evidence for success in the transfer costing of internal services or shared services or products within a company. The case of activity-based costing (ABC) is used to explore how the proponents have developed a framework linking Quality, Cost and Delivery (QCD) components of products and services. The QCD performance indices, which are the natural properties of products and services, will form part of the Service Level Agreements between the internal service providers (Shared Services Centers) and internal customers (Profit Centers) of the company. This framework optimizes the use of overhead expenses to the end products of the company. This book also discusses the various cost components of the products and services using the full absorption costing principle. It is a revolutionary idea in the sense that all activity costs are considered variable costs and product costs come from activity costs using various cost drivers. The Principal Component Analysis (PCA), the multi-variate statistical tool, is applied using SPSS to analyze which independent variables contribute significantly to the Product Unit Price (PUP) and which should be given more emphasis in decision making process.
