Describing both the practical details of interest to students and the high-level concepts and abstractions highlighted by faculty, *The Tao of Computing, Second Edition* presents a comprehensive introduction to computers and computer technology. This edition updates its popular predecessor with new research exercises and expanded discussion questions. It uses a question-and-answer format to provide thoughtful answers to the many practical questions that students have about computing. Among the questions answered, the book explains: What capabilities computers have in helping people solve problems and what limitations need to be considered Why machines act the way they do What is involved in getting computers to interact with networks The book offers a down-to-

earth overview of fundamental computer fluency topics, from the basics of how a computer is organized and an overview of operating systems to a description of how the Internet works. The second edition describes new technological advances including social media applications and RSS feeds.

"Dr. Taylor Hartman offers an incisive system for improving your understanding of yourself and others and strengthening your day-to-day relationships. In first *The People Code* and *The Character Code*, Dr. Hartman introduces the Color Code Personality Profile, explaining why people do what they do by identifying four basic personality types and showing you how to use "color profiles" to cultivate rich and balanced character and relationships. All people... possess one of four driving "core motives," classified by color: Red ("power wielders"), Blue ("do-gooders"), White ("peacekeepers"), and Yellow ("fun lovers"). Once you understand your color code--and the color codes of others--you can analyze your own innate personality and use that knowledge to balance your relationships, both personal and professional"--from back cover.

Recent advances in the fields of remote sensing, engineering geology, seismology, and earthquake engineering have developed a need for a systematic comprehensive review of the basic principles and methods of applying remote sensing for evaluation of earthquakes hazards and seismic risk. This paper responds to this need by reviewing basic concepts, summarizing essential, state-of-the-art knowledge of theory and instrumental methods, establishing procedures evaluations, and discussing representative case histories that illustrate earthquake hazard evaluations that are based on remote sensing analysis. The approach that is recommended is based on a 'multi' approach that uses an integrated and systematic study of a region or a fault with a variety of imagery varying from small-scale (synoptic) to

large-scale (detailed). The imagery analysis should be followed by a ground verification program of study that should include both ground and aerial reconnaissance examination of the major geologic structures of concern. The character of the earthquake hazards is discussed in the context of the lithologic, structural, vegetational, and topographic variations that are associated with different types of active geologic structures. The response of earth materials, landforms, and geologic structures is summarized for the several main types of passive and active electromagnetic radiation used in current remote-sensing practice. Limitations of the different spectral regions used in remote sensing are reviewed to assist in the selection of ideal methods or sequences of methods of study for effective evaluation of active or capable faults and for assessing the earthquake potential of geological structures that may affect a given engineering site.
