Pharmacology of Recreational Drugs: The Neurology of How Drugs Work introduces readers to neurobiology and provides detailed mechanistic explanations of how drugs work. After an opening explanation of normal nerve and brain function, the text goes on to explore how various drugs change the way a person feels and sees the world. While exploring topics such as pharmacokinetics and pharmacodynamics, addiction, cognition, opioids, alcohol, cannabis, hallucinogens, and CNS stimulants the book carefully explains connections starting at the minuscule level of a drug binding to a receptor, through to the holistic - the physiological and psychological effects of the drug on the person. Along the way students learn about the way each drug effects neurons, the role of these neurons in the brain, and the neurobiology of the drug experience.

Each chapter includes multiple choice and essay questions for each. Suggestions for further reading create opportunities for extended exploration of the topics. Common-sense and approachable in style, yet comprehensive in coverage, Pharmacology of Recreational Drugs is well-suited to courses in biology, neurobiology, and health sciences, as well as those in nursing programs. It is also suitable for the novice, non-science reader and no prerequisite knowledge is required.

There are hundreds, if not thousands, of substances that are used to modify behavior. While different classes of substances have known effects, one has only to see a group of people drinking to

excess to recognize that not everyone responds in the same way to a given substance. Why do substances have the behavioral effects they do, and why do individuals vary in their responses to them? This book provides a conceptual framework for answering such questions. Introduction to Behavioral Pharmacology includes a short overview of behavioral analysis and general pharmacology, followed by detailed discussion of assessment of drug effects, the stimulus properties of drugs, drug abuse, and more.
