This is an essential aid in the initial design and planning of a project. The relevant building type is located by a comprehensive index and cross reference system, a condensed commentary covers user requirements, planning criteria, basic dimensions and other considerations of function, siting aspect etc. A system of references based on an extensive bibliography supports the text. In every section plans, sections, site layouts, design details and graphs illustrated key aspects of a building type's design. Most illustrations are dimensioned or scaled - the metric system of measurement is used throughout, and the equivalent in feet/inches can easily be read either off a graphic scale on the page or from the built-in conversion table. The illustrations are international in origin and include both well know and less famous designers. Architects Data is primarily a handbook of building types rather than of construction techniques and details. However its treatment of components (such as doors and windows) and of spaces for building services is extremely thorough, since consideration of this data is an essential element of the planning process. The opening pages of basic data on man and his buildings cover critical subjects such as scale, drawing practice, noise, light and space for the same reason. Particular attention has also been paid to the implications of energy conservation, means of escape from fire and the needs of the elderly and the disabled.

101 Rules of Thumb sets out the essential elements of low energy architecture in a fresh, intuitive

way. In an area where ever-changing technology and complex legislation and can cloud the designer's thought-processes, this book encourages the designer to think clearly and intuitively about the fundamentals of low energy buildings. With reliable, simple rules of thumb that will provide new ideas and refresh the designer's palette, each page focuses on a single piece of advice or guidance along with a clear hand-drawn illustration, while there are also plenty of tips and more detailed information for those who wish to dig deeper. The emphasis is on passive low-energy principles, and the rules of thumb cover all the design fundamentals from site and location to orientation and form, peppered with some which will help the designer to think 'outside the box' about the design process itself.

Architects' Data Metric Handbook Planning and Design Data

If a building could speak, what would it say? What would it sound like? Would it be worth listening

to? This book treats buildings as deeply human creations - built by people for people; they come to embody the dreams, imaginings and stories that take place within them. David Littlefield and Saskia Lewis argue that buildings have voices and that it is worth listening to what they have to say. By focusing on elderly structures that are the subject of reinvention, this book examines how the buildings guide architects and artists. These reinventions, or re-imaginings, are not merely examples of straightforward conservation, nor simple exercises in contrasting old and new; they represent a more sensitive, personal approach to creative reuse. The authors' accounts of more than 20 historic buildings and their interviews with the people responsible for renewing them, demonstrate that the poetic qualities of the places we inhabit are not limited to just architectural style. In this book, the voices of an abandoned cathedral, a former brothel, a stately home and a Royal Mail sorting office reveal themselves. Listening to these voices opens up a new dimension to understanding the lives and meanings of old buildings.

A designer must take a client's programming needs into account and must also consider how other factors such as building codes and environmental factors affect a spatial composition. Space Planning Basics, now in its Third Edition, offers a highly visual, step-by-step approach to developing preliminary floor plans for commercial spaces. The book provides tools for visualizing space and walks the designer through other considerations such as building code requirements and environmental control needs. Specific programming techniques covered include matrices, bubble diagrams, CAD templates, block plans, and more. New to this edition are coverage of the basics of stair design, an essential aspect for planning spaces.
