Background  
The success  
rate of  
implants in  
health  
patients is  
remarkably  
high, however,  
it is lower in  
immunodeficie  
ncy patients.

As one of the  
most common  
immunodeficie  
ncy disorders,  
systemic  
lupus  
erythematosu  
s (SLE)  
influence bone  
metabolism  
directly and  
indirectly. To  
date, there is

no guideline on the placement of implants in immunodeficiency patients, including SLE patients. This paper focus on the implant rehabilitation in patients with systemic lupus erythematosus.

**Aim/Hypothesis**  
The aim of this paper is to discuss if dental implant is an option even in patient with systemic lupus erythematosus.  
**Materials and Methods**  
**Patient Selection:** A 35-year-old

women with a 3-year history of SLE and 3-year history of glucocorticoid was selected, and her SLE has been well controlled for 2 years. As a nurse in ICU, she gets insufficient sleep. She missed one teeth 6 month ago. On exam, she presented with atrophy depression in the left central incisor (21) region, and the cone beam computerized tomography (CBCT) scan showed atrophic maxilla in the 21 site. The

bone volume is about 5.0X17.6mm. There is no periodontitis nor decays. **Surgical Stage:** During the clinical procedure, the patient keeps taking the glucocorticoid as usual. Under local anesthesia, the flap was elevated and an implant (Nobel PMC 4.3X11.5mm) was inserted, then the cover screw was connected. After that, Bio-oss(0.25g) and Bio-gide were implanted in the buccal and

the flap was closed within tension free. A fixed temporary prostheses supported by adjacent teeth was applied. Results Postoperative CBCT shows the bone graft and the ideal location of the implant, as well as sufficient peri-implant bone. After the operation, regular follow-up visits were carried out to evaluate healing, keep oral hygiene and adjust the temporary prostheses. The implant was inserted 3

months ago, and according to the recent X-ray, the implant formed an ideal osseointegration. We plan to re-shape the gingiva in a minimally invasive way in the near future, and finally restore the left central incisor by all-ceramic restoration. Conclusions and Clinical Implications Under SLE, the general and oral condition should be evaluated, as infections are potential threats for osteointegrati

on. Besides that, a standard procedure is important, and a minimally invasive way is necessary. Moreover, regular follow-up visits are required. As glucocorticoid is vital for the patients with SLE, we found that they can be kept during the clinical procedure. In conclusion, implants can be applied to patients with SLE. *Homo homini lupus* W B Saunders Company  
 Berlin-based artist Thomas Helbig's early drawings, paintings and sculptures are a bit

claustrophobic --like they've emerged from a Hieronymus Bosch tableau. His sculptural works are crafted from found objects that he shatters and reconfigures to create hybridized assemblages. The violent gestural surfaces of these works extend into his two-dimensional pieces, which allude to the unwieldy forces of nature through the use of stylistic devices as diverse as the political

subtexts of abstraction and the spiritual aspects of Romanticism. Helbig's paintings of the past two years--the focus of this volume--have gained a little breathing room. His brightly colored chalk drawings, for example, feature pared down and less overtly aggressive Japanese scroll-like imagery. The title "Homo Homini Lupus" references Thomas Hobbes' well-known--rather

jaundiced--view of the horrors of which human beings are capable when left to their own devices, which seems to suggest that Helbig's vision is as dark as ever.
