The claim that all human thought involves "interpretation," that all human thought is in some way relative to a contingent context of cognitive, theoretical, practical, and aesthetic considerations, has become widely accepted, but what we understand by "truth" and how we should best pursue it are questions raised with renewed force once a hermeneutical starting point has been embraced. Brice R. Wachterhauser's collection *Hermeneutics and Truth* is an attempt to contribute to this conversation. No thinkers have wrestled with the issue of truth and interpretation in more illuminating ways for the Continental tradition of philosophy than Heidegger and Gadamer. *Hermeneutics and Truth* is a dual focus on Heidegger and Gadamer, but it concentrates primarily on Gadamer's efforts to think through the issue of truth for hermeneutics and only secondarily on Heidegger's thought on this issue.

Information technology has been, in recent years, under increasing commercial pressure to provide devices and systems which help/ replace the human in his daily activity. This pressure requires the use of logic as the underlying foundational workhorse of the area. New logics were developed as the need arose and new foci and balance has evolved within logic itself. One aspect of these new trends in logic is the rising importance of model based reasoning. Logics have become more and more tailored to applications and their reasoning has become more and more application dependent. In fact, some years ago, I myself coined the phrase "direct deductive reasoning in application areas", advocating the methodology of model-based reasoning in the strongest possible terms. Certainly my discipline of Labelled Deductive Systems allows to bring "pieces" of the application areas as "labels" into the logic. I therefore heartily welcome this important book to Volume 25 of the Applied Logic Series and see it as an

important contribution in our overall coverage of applied logic.

*A Logical Introduction to Probability and Induction* is a textbook on the mathematics of the probability calculus and its applications in philosophy. On the mathematical side, the textbook introduces these parts of logic and set theory that are needed for a precise formulation of the probability calculus. On the philosophical side, the main focus is on the problem of induction and its reception in epistemology and the philosophy of science. Particular emphasis is placed on the means-end approach to the justification of inductive inference rules. In addition, the book discusses the major interpretations of probability. These are philosophical accounts of the nature of probability that interpret the mathematical structure of the probability calculus.

Besides the classical and logical interpretation, they include the interpretation of probability as chance, degree of belief, and relative frequency. The Bayesian interpretation of probability as degree of belief locates probability in a subject's mind. It raises the question why her degrees of belief ought to obey the probability calculus. In contrast to this, chance and relative frequency belong to the external world. While chance is postulated by theory, relative frequencies can be observed empirically. *A Logical Introduction to Probability and Induction* aims to equip students with the ability to successfully carry out arguments. It begins with elementary deductive logic and uses it as basis for the material on probability and induction. Throughout the textbook results are carefully proved using the inference rules introduced at the beginning, and students are asked to solve problems in the form of 50 exercises. An instructor's manual contains the solutions to these exercises as well as suggested exam questions. The book does not presuppose any background in mathematics, although sections 10.3-10.9 on statistics are technically sophisticated and optional. The textbook is suitable for lower level undergraduate courses in philosophy and logic.

The Monodoxy is a 275,000 word-long philosophical disquisition categorised as the first of twelve disquisitions that, when considered collectively, form The Omnidoxy, the founding treatise of the philosophy of Astronism established by Cometan. The disquisition comprises of hundreds of discourses which are themselves titled by rubrals and written according to a style and structure known as insentence. The Monodoxy's authorship solely rests with Cometan, the first Millettic philosopher and the founder of Astronism whom began writing The Monodoxy at the age of just seventeen through what he termed as personal inspiration. The Monodoxy has been said to formulate the thematic identity of the philosophy of Astronism due to its prominent focus on the elements, progeny, and phenomena of The Cosmos in a distinct way to all the other eleven disquisitions forming The Omnidoxy. Hundreds of new schools of thought, disciplines of study, and philosophical belief orientations hold their roots in The Monodoxy in addition to thousands of new terms, concepts, and theories which hold a distinguished originality and Cometanic style combined with an Astronic identity. There are a total of fifty-three discourses which constitute The Monodoxy, each of which holds its own special title known as a rubral which are used to provide overviews of the discourses to which they are associated.

In his new book, Raymond Smullyan, grand vizier of the logic puzzle, joins Scheherazade, a charming young woman of "fantastic logical ingenuity," to give us 1001 hours of brain-teasing fun.

Scheherazade, we find, has gotten back into hot water with the king, and is once more in danger of losing her head at down. But, thinking quickly, she tempts the king to stay her execution by posing him the most delightfully devious mathematical and logic puzzle ever invented. They keep him guessing for many more nights until the fatal hour has passed, and she keeps her head. The Riddle of Scheherazade includes several wonderful old chestnuts and many fiendishly original puzzles, 225 in all. There are logic tricks and number games, metapuzzles (puzzles about puzzles), liar/truth-teller exercises, Gödelian brian twisters, baffling paradoxes, and an excursion, under Scheherazade's expert guidance, into an amusing new field invented by Smullyan, called "coercive" logic, in which the answer to a problem can actually change the fate of the puzzler! An absolute must for all puzzle fans—from the middle-school whiz to the sophisticated mathematician or computer scientist.

Starting with the analysis of cognitive situations which appear in everyday life, and by means of the logical analysis of some games, the author deals with applied logic in the sense of the general methodology of reasoning. The book acquaints the reader with some forms and operations of reasoning which are applied in the process of scientific cognition as well as in daily activities that require thought. As opposed to a number of well-known and unique handbooks and textbooks on pure logic this books conveys learning, and in many cases original thoughts, through witty dialogues, in an entertaining way.

In today's society, everything is in question. The reflexive questioning of modernity has fundamentally problematized society, including philosophy, which has experienced a crisis of metaphysics. Michel Meyer's problematology answers this crisis by questioning questioning, unfolding a new way of doing philosophy, with special relevance for the study of society. In this first-ever extended treatment of Meyer's work, Nick Turnbull examines the main features of problematology, including the principle of questioning and the deduction of an original conception of difference, based on the question-answer relationship. Turnbull shows how these concepts produce new perspectives in the philosophy of the emotions, history, meaning, politics, rhetoric and science. He applies Meyer's ideas to key questions in the philosophy of social science, showing how problematology offers important insights for understanding contemporary society. The book compares problematology with the work of well-known thinkers, including Bourdieu, Castoriadis, Collingwood, Derrida, Dewey, Gadamer, Heidegger and Lyotard. Turnbull uses problematology and rhetoric to explain how meaning is constructed through practice in the negotiation of social distance.
