Why the Porcupine is Not a Bird Jones & Bartlett Learning

Animal biotechnology is an integral component of agriculture. Supported with over 50 figures and more than 30 tables, this textbook is a must have for undergraduates and postgraduates of various agriculture and animal husbandry academia, teachers, professionals, and researchers in basic as well as applied animal sciences including biotechnology, nutrition, physiology and reproduction. The book covers various topics, including economically important livestock

breeds, paradigm shifts in livestock production, biotechnology in animal nutrition and in livestock-assisted reproduction, and genomics and genetic engineering tools in livestock production and management.

Reviews state-of-the-art technologies in modern heuristic optimization techniques and presents case studies showing how they have been applied in complex power and energy systems problems. Written by a team of international experts, this book describes the use of metaheuristic applications in the analysis and design of electric power systems. This includes a discussion of optimum energy and

commitment of generation (nonrenewable & renewable) and load resources during day-to-day operations and control activities in regulated and competitive market structures, along with transmission and distribution systems. Applications of Modern Heuristic Optimization Methods in Power and Energy Systems begins with an introduction and overview of applications in power and energy systems before moving on to planning and operation, control, and distribution. Further chapters cover the integration of renewable energy and the smart grid and electricity markets. The book finishes with final conclusions drawn by the editors. Applications of Modern Heuristic

Optimization Methods in Power and Energy Systems: Explains the application of differential evolution in electric power systems' active power multi-objective optimal dispatch Includes studies of optimization and stability in load frequency control in modern power systems Describes optimal compliance of reactive power requirements in near-shore wind power plants Features contributions from noted experts in the field Ideal for power and energy systems designers, planners, operators, and consultants, Applications of Modern Heuristic Optimization Methods in Power and Energy Systems will also benefit engineers, software developers, researchers, academics, and students. *Communities in Action* John Wiley & Sons Where did we come from? What were our ancestors like? Why do we differ from other animals? How do scientists trace and construct our evolutionary history? The Evolution of Our Tribe: Hominini provides answers to these questions and more. The book explores the field of paleoanthropology past and present. Beginning over 65 million years ago,

Welker traces the evolution of our species, the environments and selective forces that shaped our ancestors, their physical and cultural adaptations, and the people and places involved with their discovery and study. It is designed as a textbook for a course on Human Evolution but can also serve as an introductory text for relevant sections of courses in Biological or General Anthropology or general interest. It is both a comprehensive technical reference for relevant terms, theories, methods, and species and an overview of the people, places, and discoveries that have imbued paleoanthropology with such fascination, romance, and mystery. Evolution The Energy and Resources Institute (TERI) John Dewey's Democracy and Education addresses the challenge of providing quality public education in a democratic society. In this classic work Dewey calls for the complete renewal of public education, arguing for the fusion of vocational and contemplative studies in education and for the necessity of universal education for the advancement of self and society. First published in

1916, Democracy and Education is regarded as the seminal work on public education by one of the most important scholars of the century. Application of Modern Heuristic Optimization Methods in Power and Energy Systems Academic Press

Fascinating, engaging, and extremely visual, this Enhanced Thirteenth Edition of FOUNDATIONS OF ASTRONOMY brings readers up-to-date on the developments and discoveries in the exciting field of astronomy as recent as the summer 2015 New Horizons studies of Pluto and its moons. Throughout the book, authors Michael Seeds and Dana Backman emphasize the scientific method as they guide students to answer two fundamental questions: What are we? And how do we know? In every chapter, the book discusses the interplay between evidence and hypothesis, providing both factual information and a conceptual framework for understanding the logic of science. The evolution of the human brain and cognitive ability is one of the central themes of physical/biological anthropology. This book discusses the emergence of human cognition at a conceptual level, describing it as a process of long adaptive stasis interrupted by short periods of cognitive advance. These advances were not linear and directed, but were acquired indirectly as part of changing human behaviors, in other words through the process of exaptation (acquisition of a function for which it was not originally selected). Based on studies of the modern human brain, certain prerequisites were needed for the development of the early brain and associated cognitive advances. This book documents the energy and nutrient constraints of the modern brain, highlighting the significant role of long-chain polyunsaturated fatty acids (LC-PUFA) in brain development and maintenance. Crawford provides further emphasis for the role of essential fatty acids, in particular DHA, in brain development, by

discussing the evolution of the eye and neural systems. This is an ideal book for Graduate students, post docs, research scientists in Physical/Biological Anthropology, Human Biology, Archaeology, Nutrition, Cognitive Science, Neurosciences. It is also an excellent selection for a grad student discussion seminar.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to

their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts. *Benchmarks assessment workbook* Elsevier
Newly updated, *Botany: An Introduction to Plant Biology*, Fourth Edition provides an current, thorough overview of the fundamentals of botany. The topics and chapters are organized in a sequence that is easy to follow, beginning with the

most familiar -- structure -
- and proceeding to the
less familiar -- metabolism
-- then finishing with
those topics that are
probably the least familiar
to most beginning
students -- genetics,
evolution, the diversity of
organisms, and ecology.

How did life evolve on

Earth? The answer to this
question can help us

understand our past and
prepare for our future.

Although evolution

provides credible and
reliable answers, polls

show that many people
turn away from science,

seeking other

explanations with which
they are more

comfortable. In the book

Science, Evolution, and

Creationism, a group of

experts assembled by the
National Academy of

Sciences and the Institute

of Medicine explain the
fundamental methods of

science, document the

overwhelming evidence in
support of biological

evolution, and evaluate

the alternative
perspectives offered by
advocates of various kinds
of creationism, including
"intelligent design." The
book explores the many
fascinating inquiries being
pursued that put the
science of evolution to
work in preventing and
treating human disease,
developing new
agricultural products, and
fostering industrial
innovations. The book
also presents the
scientific and legal
reasons for not teaching
creationist ideas in public
school science classes.

Mindful of school board
battles and recent court

Evolution, and
Creationism shows that
science and religion
should be viewed as
different ways of
understanding the world
rather than as frameworks
that are in conflict with
each other and that the
evidence for evolution can
be fully compatible with

educators, students,
teachers, community
leaders, legislators, policy
makers, and parents who
seek to understand the
basis of evolutionary
science, this publication
will be an essential
resource.

River restoration projects

are designed to recreate

functional characteristics

within a context of physical stability. They tend to focus on the development and application of geomorphic principles for river restoration design. Due to different models obtaining different results on the same problem, incomplete or absent data, and climatic/social/cultural changes, the designers and managers of such projects frequently face high levels of uncertainty. This book will provide a systematic overview of the issues involved in minimizing and coping with uncertainty in river restoration projects. A series of thematic sections will be used to define the various sources of uncertainty in restoration projects and how these show at different points in the life cycle (design, construction and post-construction phases) of restoration projects. The structure of the book will offer a rational theoretical analysis of the problem while providing practical guidance in managing the different sources of uncertainty. A wide range of case studies will be included from Europe, North America and Australasia

Darwin's Conjecture

University of Chicago Press
 The story of American Institutional Economics, from its foundations through its supremacy and subsequent decline is an extremely interesting one. Today with the return of Darwinian ideas to social sciences, changes in psychology and a revival of pragmatist philosophy, the intellectual conditions for a revival and reconstruction of American Institutionalism are arguably in place. Few are better qualified to provide an authoritative, wide-ranging account of the rise, fall and potential rebirth of institutional economics than Geoffrey Hodgson. This well-written comprehensive study offers an interpretation of Veblen and American Institutionalism that places Darwinism at the center. In this and other aspects, it challenges prevailing accounts of the nature and potential of American Institutionalism. The author's position as one of the most important economists in the world is becoming cemented by his marvelous history of important books. This book will only add to his status. The book will be read and re-read by academics and students

The naturalist and geologist Charles Darwin (1809–82) ranks as one of the most influential scientific thinkers of all time. In the nineteenth century his ideas about the history and diversity of life - including the evolutionary origin of humankind - contributed to major changes in the sciences, philosophy, social thought and religious belief. The Cambridge Companion to Darwin has established itself as an indispensable resource for anyone teaching or researching Darwin's theories and their historical and philosophical interpretations. Its distinguished team of contributors examines Darwin's main scientific ideas and their development; Darwin's science in the context of its times; the influence of Darwinian thought in recent philosophical, social and religious debate; and the importance of Darwinian thought for the future of naturalist philosophy. For this second edition, coverage has been

expanded to include two new chapters: on Darwin, Hume and human nature, and on Darwin's theories in the intellectual long run, from the pre-Socratics to the present. Investigating Life on Earth Cengage Learning
 “Traces both historically and sociologically the changing attitudes on race-mixing (miscegenation) in western culture . . . clear, well written and useful.”
 —Journal of the History of Biology This book explores changing American views of race mixing in the twentieth century, showing how new scientific ideas transformed accepted notions of race and how those ideas played out on college campuses in the 1960s. In the 1930s it was not unusual for medical experts to caution against miscegenation, or race mixing, espousing the common opinion that it would produce biologically dysfunctional offspring. By the 1960s the scientific community roundly refuted this theory. Paul Lawrence Farber traces this revolutionary shift in scientific thought, explaining how developments in modern population biology, genetics, and anthropology proved that

opposition to race mixing was a social prejudice with no justification in scientific knowledge. In the 1960s, this new knowledge helped to change attitudes toward race and discrimination, especially among college students. Their embrace of social integration caused tension on campuses across the country. Students rebelled against administrative interference in their private lives, and university regulations against interracial dating became a flashpoint in the campus revolts that revolutionized American educational institutions. Farber's provocative study is a personal one, featuring interviews with mixed-race couples and stories from the author's student years at the University of Pittsburgh. As such, *Mixing Races* offers a unique perspective on how contentious debates taking place on college campuses reflected radical shifts in race relations in the larger society. “A fascinating look at how evolutionary science has changed alongside social beliefs.”

 Using this textbook, students will learn about cladistics, molecular phylogenies and the molecular-genetical basis of evolutionary change, including the important role of protein networks, symbionts and holobionts, together with the core principles of developmental biology.
Hominini Jones & Bartlett Learning
 Phylogenetic comparative approaches are powerful analytical tools for making evolutionary inferences from interspecific data and phylogenies. The phylogenetic toolkit available to evolutionary biologists is currently growing at an incredible speed, but most methodological papers are published in the specialized statistical literature and many are incomprehensible for the user community. This textbook provides an overview of several newly developed phylogenetic comparative methods that allow to investigate a broad array of questions on how phenotypic characters evolve along the branches of phylogeny and how such mechanisms shape

complex animal communities and interspecific interactions. The individual chapters were written by the leading experts in the field and using a language that is accessible for practicing evolutionary biologists. The authors carefully explain the philosophy behind

different methodologies and provide pointers – mostly using a dynamically developing online interface – on how these methods can be implemented in practice. These “conceptual” and “practical” materials are essential for expanding the qualification of both students and scientists,

but also offer a valuable resource for educators. Another value of the book are the accompanying online resources (available at: <http://www.mpcm-evolution.com>), where the authors post and permanently update practical materials to help embed methods into practice.
