Inside the Cold War Twayne Publishers

'This is a book about the stories we tell ourselves and one woman's determination to make hers true' Spectator 'A fresh . . . heartfelt book that . . . makes you want to throw away your mobile, run for the hills and learn a traditional craft' The Lady 'A spirited defence of manual labour' TLS At the age of twenty-six, Whitney Brown met a dry-stone waller. Within weeks she was out on the hill with him in Wales, learning the language of dry-stone walling. Far away from the pressures of her old life, she found deep satisfaction in working with her hands, in the age and heft of the stones, and the ring of the hammer. Out under the open sky, Whitney relished every sore muscle and smashed finger, opportunity to stand atop a wall she'd just built and feel like the strongest woman alive. Between Stone and Sky is a celebration of the raw and rugged splendour of the Welsh countryside and the enduring beauty and relevance of traditional craftsmanship. It is an unflinchingly honest account of the emotional struggle to become and belong. Most of all, it is an empowering story of female friendship, accepting uncertainty and risk, and crossing oceans in pursuit of dreams.

Irish Stone Walls Tilbury House Nature Book

This volume collects the best scientific contribution presented in the 3rd World Conference on Terraced Landscapes held in Italy from 6th to 15th October 2016, offering a deep and multifaceted insight into the remarkable heritage of terraced landscapes in Italy, in Europe and in the World (America, Asia, Australia). It consists of 2 parts: a geographical overview on some of the most important terraced systems in the world (1st part), and a multidisciplinary approach that aims to promote a multifunctional

vision of terraces, underlining how these landscapes meet different needs: cultural and historical values, environmental and hydrogeological functions, quality and variety of food, community empowerment and sustainable development (2nd part). The volume offers a great overview on strengths, weaknesses, functions and strategies for terraced landscapes all over the world, summarizing in a final manifest the guidelines to provide a future for these landscapes as natural and cultural heritage.

Rock Fences of the Bluegrass Constable

This text shows how to build a wall using the traditional method of dry stone masonry in which carefully selected stones are properly stacked and held together without mortar. As well as being beautiful, a dry stone wall is stronger, more stable and more resistant to climate than a mortared wall. More than 100 full colour photographs of walls, bridges and decorative garden elements in various steps of construction are presented as well as illustrations that show the steps and cross sections that highlight the building methods.

General Adams reflects on his experiences in the cold war, during which he served in both manned bombers and missile silos. He tells stories of famous and not-so-famous cold warriors, including some from the US Navy. Some stories are humorous; some stories are tragic. Having traveled extensively in Russia and some former Soviet Union states after retirement, General Adams tells us about his former adversaries, the Soviet cold warriors. In the process, he leaves no doubt about his respect for all who served so valiantly in the "strategic triad"-- the strategic command, the ICBM force, and the submarine Navy.

During the past five years increased awareness of environmental contamination by nitroaromatic compounds has led to a dramatic increase in research on their biodegradation. The resulting discoveries have markedly extended our understanding of degradation mechanisms and pathways in bacteria and fungi. Furthermore, this new basic knowledge promises the development of field applications of biodegradation systems for nitroaromatic compounds. In May of 1994, an International Symposium on the Biodegradation of Nitro aromatic Compounds was held in Las Vegas, Nevada. This symposium brought together the scientists at the frontiers of research into the biodegradation of nitro aromatic compounds. The invited speakers were asked to review their area of expertise and write a critical, comprehensive synthesis of their work and related work by others. This book is the result of their efforts. The emphasis of the reviews is on basic research in biodegradation and biotransformation. Therefore, the reactions of nitroaromatic compounds in plants, animals, bacteria, fungi, soil, and even nonbiological systems are considered. The goal of the work is to provide the reader with an appreciation of the tremendous range of possibilities for metabolism of aromatic nitro compounds and the experimental approaches used to

understand them. This volume should be of interest to biochemists, microbiologists, engineers, toxicologists, and anyone interested in the behavior of synthetic chemicals in the environment or in living systems. Furthermore, a variety of commercial applications can be envisioned for some of the reactions described here.

There once may have been 250,000 miles of stone walls in America's Northeast, stretching farther than the distance to the moon. They took three billion man-hours to build. And even though most are crumbling today, they contain a magnificent scientific and cultural story-about the geothermal forces that formed their stones, the tectonic movements that brought them to the surface, the glacial tide that broke them apart, the earth that held them for so long, and about the humans who built them. Stone walls layer time like Russian dolls, their smallest elements reflecting the longest spans, and Thorson urges us to study them, for each stone has its own story. Linking geological history to the early American experience, *Stone by Stone* presents a fascinating picture of the land the Pilgrims settled, allowing us to see and understand it with new eyes.

Environmental engineering, is by its very nature, interdisciplinary and it is a challenge to develop courses that will provide students with a thorough broad-based curriculum that includes every aspect of the environmental engineering profession.

Environmental engineers perform a variety of functions, most critical of which are process design for waste treatment or pollution prevention, fate and transport modeling, green engineering, and risk assessment. Chemical thermodynamics and chemical kinetics, the two main pillars of physical chemistry, are two of the many subjects that are crucial to environmental engineering. Based on the success of the successes of previous editions, *Principles of Environmental Thermodynamics and Kinetics*, Fourth Edition, provides an overarching view of the applications of chemical thermodynamics and kinetics in various aspects of the field of environmental science and engineering. Written by experts in the field, this new edition offers an improved logical progression of the text with principles and applications, includes new case studies with current relevant environmental events and their relationship to thermodynamics and kinetics, and adds examples and problems for the updated environmental events. It also includes a comprehensive analysis of green engineering with relation applications, updated appendices, and an increased number of thermodynamic and kinetic data for chemical species. While it is primarily intended for undergraduate students at the junior/senior level, the breadth and scope of this book make it a valuable resource for introductory graduate courses and a useful reference for environmental engineers.

It is difficult to believe that our planet has been weaponized before our very eyes, but that is exactly what has happened. First, we were seduced by the convenience of a wireless world; then, atmospheric weather experimentation in the guise of carbons "climate change" converted the air we breathe into an antenna. Now, the geo-engineering we've been subjected to for two decades is being normalized as the "Star Wars" Space Fence rises around and within us. Is this the Space Age we were promised?

Filled with practical applications and research, *Biodegradation of Nitroaromatic Compounds and Explosives* presents an international perspective on environmental contamination from explosives. It covers biodegradation strategies for DNT and a wide variety of other nitroaromatic compounds of environmental significance and makes the information accessible to practicing environmental and chemical engineers. *Biodegradation of Nitroaromatic Compounds and Explosives* gives you a synthesis of ongoing research and an appreciation of the remarkable range of biochemical strategies available for the transformation of nitroaromatic compounds. It provides a realistic assessment of the current and potential field applications of the various strategies.

Walls in the Landscape Artisan Books

Based on archival sources and oral history, this book reconstructs a border-building process in Namibia that spanned more than sixty years. The process commenced with the establishment of a temporary veterinary defence line against rinderpest by the German colonial authorities in the late nineteenth century and ended with the construction of a continuous two-metre-high fence by the South African colonial government sixty years later. This 1250-kilometre fence divides northern from central Namibia even today. The book combines a macro and a micro-perspective and differentiates between cartographic and physical reality. The analysis explores both the colonial state's agency with regard to veterinary and settlement policies and the strategies of Africans and Europeans living close to the border. The analysis also includes the varying perceptions of individuals and populations who lived further north and south of the border and describes their experiences crossing the border as migrant workers, African traders, European settlers and colonial officials. The Red Line's history is understood as a gradual process of segregating livestock and people, and of constructing dichotomies of modern and traditional, healthy and sick, European and African.

The purpose of this document is to assist solid waste managers and key decision-makers in municipalities of low- and middle-income countries to decide whether to involve the private sector in solid waste services and, if so, how this should be done. The information in this book is not just theory; it is based on a wide range of case studies and extensive international experience. This Pack consists of five separate booklets: i) an Executive Overview, introducing the Pack, and directing the reader to more detailed discussions in the subsequent parts; ii) the main part, the Guidance Note, which contains the arguments for private sector participation, reviews the options, explains the issues that must be considered, and suggests the steps leading to implementation of its recommendations. There are frequent references to experiences and lessons learned in Africa, Asia, and America; iii) the Tools - criteria, checklists, sample terms of reference and questionnaire forms, iv) a comprehensive Word List, and v) a CD with sample contracts and agreements for both collection and disposal operations, and other tools.

Unique single reference supports functional and cost-efficient designs of blast resistant buildings Now there's a single reference to which architects, designers, and engineers can turn for guidance on all the key elements of the design of blast resistant buildings that satisfy the new ASCE Standard for Blast Protection of Buildings as well as other ASCE, ACI, and AISC codes. The Handbook for Blast Resistant Design of Buildings features contributions from some of the most knowledgeable and

experienced consultants and researchers in blast resistant design. This handbook is organized into four parts: Part 1, Design Considerations, sets forth basic principles, examining general considerations in the design process; risk analysis and reduction; criteria for acceptable performance; materials performance under the extraordinary blast environment; and performance verification for technologies and solution methodologies. Part 2, Blast Phenomena and Loading, describes the explosion environment, loading functions needed for blast response analysis, and fragmentation and associated methods for effects analysis. Part 3, System Analysis and Design, explains the analysis and design considerations for structural, building envelope, component space, site perimeter, and building system designs. Part 4, Blast Resistant Detailing, addresses the use of concrete, steel, and masonry in new designs as well as retrofitting existing structures. As the demand for blast resistant buildings continues to grow, readers can turn to the Handbook for Blast Resistant Design of Buildings, a unique single source of information, to support competent, functional, and cost-efficient designs.

Corbelling is a weight-bearing structuring principle whose earliest instance can be found in fifth-millennium-BC domed burial chambers. Curiously, corbelled domes resurfaced as a global architectural phenomenon about 200 years ago. Renate Löbbecke has been photographing such structures for more than 25 years, and gathers the results here.

Gray rock fences built of ancient limestone are hallmarks of Kentucky's Bluegrass landscape. Why did Kentucky farmers turn to rock as fence-building material when most had earlier used hardwood rails? Who were the masons responsible for Kentucky's lovely rock fences and what are the different rock forms used in this region? In this generously illustrated book, Carolyn Murray-Wooley and Karl Raitz address those questions and explore the background of Kentucky's rock fences, the talent and skill of the fence masons, and the Irish and Scottish models they followed in their work. They also correct inaccurate popular perceptions about the fences and use census data and archival documents to identify the fence masons and where they worked. As the book reveals, the earliest settlers in Kentucky built dry-laid fences around eighteenth-century farmsteads, cemeteries, and mills. Fence building increased dramatically during the nineteenth century so that by the 1880s rock fences lined most roads, bounded pastures and farmyards throughout the Bluegrass. Farmers also built or commissioned rock fences in New England, the Nashville Basin, and the Texas hill country, but the Bluegrass may have had the most extensive collection of quarried rock fences in North America. This is the first book-length study on any American fence type. Filled with detailed fence descriptions, an extensive list of masons' names, drawings, photographs, and a helpful glossary, it will appeal to folklorists, historians, geographers, architects, landscape architects, and masons, as well as general readers intrigued by Kentucky's rock fences.
