fundamental example
is Lebesgue measure
on \mathbb{R}^n , which we
discuss in detail in the
next Chapter.

 $A = (a, c) \cup (c, b)$ is an open interval punctured at c . Then the set of accumulation points of A is the closed interval $[a, b]$. The points a, b, c are accumulation points of A that do not belong to A . An isolated point of a set is a point in the set that does not have other points in the set arbitrarily close to it.
