Principles of Accounting Volume 2 - Managerial Accounting Springer Science & Business Media
 Inhaltsangabe:Abstract: More and more companies apply electronic information systems in all their business areas. In the past, many of these systems pertained to one specific user group. However, due to high efforts and investments for maintaining these information flows, companies tend to increase the amount of attracted user groups. Thereby, the users must deal with more and more information every day. In addition, they must select the relevant information, which serves as a basis for their decisions, on

their own. This procedure and the included irrelevant information generate high efforts due to re-work requirements. Therefore, users reject more and more information. All these conditions combined with a two-user group-oriented customer information system require output adjustments to the user-specific needs. Consequently, it is necessary to identify the users, their needs, and the potential effectiveness of specific information provided by a specific system. This thesis refers to theoretical analysis models for generating an optimal concept. Thereby, it considers methods analyzing the original information system aim, user groups, their needs and the way the provided information flow can meet all these requests. These considerations represent actual conditions of Varta Gerätebatterie GmbH. Afterwards, this research compares the optimal with the actual situation in order to deduct appropriate improvement steps. Finally, this thesis suggests possible integrations and constitutes the related advantages and disadvantages based on cost accounting and

information management theory. The information flow analysis demonstrates the importance of finding appropriate methods and the key role of defining all users. Moreover, it emphasizes the significance of adjusting this flow to user needs in regular intervals due to the rapidly changing environment. The analysis of the information preparation and output indicates that communication plays a key role in exchanging information. The analysis of the optimal and the actual information system display several gaps, which VARTA should close. The actual situation analysis includes company conditions. Therefore, it is valid for practical implementation. These gaps pertain to the improvement procedure as well as to completely new integration issues.

Companies more and

more compete as integrated supply chains rather than as individual firms. Success of the entire supply chain (SC) determines the economic well-being of the individual company. With management attention shifting to supply chains, the role of management accounting (MAC) naturally must extend to the cross-company layer as well. MAC can make a significant contribution to SC success, but is faced with a multitude of problems and challenges when trying to do so. Students both in supply chain management (SCM) or management accounting (MAC) respectively, are typically not familiarized with these issues. There is still a clear gap in higher education teaching when it comes to management accounting in a cross-company setting. This textbook wants to fill the gap. It targets students who are already familiar with the fundamentals of accounting and now want to extend their expertise in the field of cross-company (or network) management accounting – with supply chains being the typical case in point. Practitioners might draw valuable insights from the text as well. This textbook

has been developed for university courses conducted in English language, especially in Germany, Austria and Switzerland. Additional questions via app: Download the Springer Nature Flashcards app for free and use exclusive additional material to test your knowledge.
