 of X-rays. There are three
 common mechanisms for
 the production of X-rays:

the acceleration of a charged particle, atomic transitions between discrete energy levels, and the radioactive decay of some atomic nuclei. Each mechanism leads to a characteristic spectrum of X-ray radiation. In the theory of classical electromagnetism, accelerating electric charges emit electromagnetic waves. - Radiation-producing devices produce X-rays by accelerating electrons through an electrical voltage potential and stopping them in a target.
- Many devices that use a high voltage and a source of electrons produce X-rays as an unwanted byproduct of device operation. These are called incidental X-rays.

Production of X-rays Production of X-rays - WKU The production of X-rays comes from two interactions: bremsstrahlung and characteristic. A bremsstrahlung interaction involves projectile electrons that emit radiation as they slow down when passing close to the nucleus of target atoms. Most diagnostic X-rays are the product of bremsstrahlung interactions. Production of X-rays | Radiology Key Dr Daniel J Bell and Dr

Prashant Mudgalet al. X-rays are produced due to sudden deceleration of fast-moving electrons when they collide and interact with the target anode. In this process of deceleration, more than 99% of the electron energy is converted into heat and less than 1% of energy is converted into x-rays. X-ray production | Radiology Reference Article ... medical x-rays? X-rays are a form of electromagnetic radiation, similar to visible light. Unlike light, however, x-rays have higher energy and can pass through most objects, including the body. Medical x-rays are used to generate images of tissues and structures inside the body. If x-rays travelling through the body also pass through an x-ray detector on the other side of the patient, an image will be formed that represents the “shadows” formed by the objects inside the body.
