In this simulation, you will use small pieces of candy marked on one side. They will be your "nuclei." You also need a paper towel on which to place your "nuclei."
Radioactive Decay: A Sweet Simulation of Half-Life
In this lesson, students will be asked to simulate radioactive decay by pouring small candies, such as plain M&M's® or Skittles®, from a cup and counting which candies fall with their manufacturer's mark down or up.

Radioactive Decay: A sweet simulation of half-life
Introduction: Testing of radioactive minerals in rocks best determines the absolute age of the rock. In radiometric dating, different isotopes of elements are used depending on the predicted age of the igneous rocks. Potassium/Argon dating is good for rocks 100,000 years old since

weblink is to a lesson that uses M&Ms or Skittles as a model to examine the rate of decay of unstable nuclei. The lesson allows students to grasp the concept that the exact time a certain nuclei will decay cannot be predicted. A printable worksheet is linked to from the web page.

Radioactive Decay: A Sweet Simulation of Half-Life Students will enjoy using M and M's to simulate radioactive decay in this activity from Science NetLinks. This lab demonstrates that the rates of decay of unstable nuclei can be measured, that the exact time that a certain nucleus will decay cannot be predicted, and that it takes a very large number of nuclei to find the rate of decay.

Radioactive Decay: A Sweet Simulation Predict what happens to an element when it undergoes alpha decay. Explain the concept of half life, including the random nature of it. Begin to gain an understanding of the forces that work to hold an atomic nucleus together (strong nuclear force) and the forces that work to break it apart (Coulomb, i.e. electric charge, force).

Radioactive Decay: A Sweet Simulation of Half-Life Introduction Radioactive decay rates are measured in half-lives. A half-life is the time required for one half of a radioisotope's nuclei to decay into its products. For example, the half-life of the radioisotope strontium-90 is 29 years. Radioactive pennies - B4204: Ms. Yang dice come in whole numbers about 16 or 17 dice would be removed. If 17 are removed from the original 100, there would be 83 remaining. One could then predict in the next roll that the number of dice that would land with the 5 face up would be $\frac{1}{6}$ (83) or 13.8. Thus the rate of decay is constant and can be used to simulate radioactive decay. Radioactive Decay: A Sweet Simulation of Half-Life. 01/08. 7.2 Balancing Nuclear
