Students in a regular physical education program typically learn skills through observation and practice. Teachers and specialists working with students who are sensory impaired with multiple disabilities face unique challenges. Because such students make up a small percentage of the population, physical education texts on adaptation, instructional strategies and activities for groups give only minimal information about working with them. This new book explores the issues of the physical education curricula for sensory handicapped children. Typically, these curricula are based on old techniques that have been used since time immemorial. Rather than examine how teachers utilize obsolete curricula, this important book examines how they effect the students.

The Framework, an official AOTA document, presents a summary of interrelated constructs that define and guide occupational therapy practice. The Framework was developed to articulate occupational therapy's contribution to promoting the health and participation of people, organizations, and populations through engagement in occupation. The revisions included in this second edition are intended to refine the document and include language and concepts relevant to current and emerging occupational therapy practice. Implicit within this summary are the profession's core beliefs in the positive relationship between occupation and health and its view of people as occupational beings. Numerous resource materials include a glossary, references and a bibliography, as well as a table of changes between the editions.

Motor Skills Acquisition in the First Year is a descriptive presentation of normal motor development and skill acquisition during the first year of life. It gives a greater understanding of normal motor development and normal movement in infants, in order to treat infants with delayed or aberrant movements. The goal of this book is to inform and enhance knowledge, understanding, and observational skills in the assessment of normal motor development, and to present an analysis of the motor components that babies use to achieve each milestone normally. It provides a background for enlarging the scope of kinesiological analysis and will serve as a stimulus for others to further investigate and analyze the kinesiological aspects of motor development.
