Code Division Multiple Access (CDMA) has become one of the main candidates for the next generation of mobile land and satellite communication systems. CDMA is based on spread spectrum techniques, which have been used in military applications for over half a century. Only recently, however, has it been recognised that spread spectrum techniques, combined with some additional steps, can provide higher capacity and better flexibility for the mobile cellular radio communications. Code Division Multiple Access Communications comprises a set of contributions from the most distinguished world scientists in the field. These papers review the basic theory and some of the most important problems related to spread spectrum and CDMA. The topics covered centre on the information theory aspects of CDMA; interference suppression and performance analysis. The material

presented in this book summarises the main problems in modern CDMA theory and practice and gives a solid starting point for studying this complex and still challenging field. As such Code Division Multiple Access Communications is essential reading for all researchers and designers working in mobile communication systems and provides an excellent text for a course on the subject.

This is the first book that takes a detailed look at the importance of phase in the design of speech processing systems. Phase, in comparison with amplitude, is often ignored for speech recognition applications. Thus, this book highlights some of the important ways in which the phase of speech signals can be utilized for sound localization, enhancement, and recognition. This book also discusses the state-of-the-art research in phase-based speech processing, starting from the basics of signal processing and recording, to single microphone speech recognition, the recognition of speech and the processing of speech by humans, as well as the importance of phase in human speech recognition and multi-microphone phase-based speech processing.

Not all artists want to create static, unilluminated works to hang on a wall, and with *Electronics for Artists*, they don't have to. With today's modern technology-LEDs, servo motors, motion sensors, speakers, and more-artwork can incorporate elements of light, sound, and motion for dramatic effects. Author and educator Simon Quellen Field has developed a primer for creative individuals looking for new ways to express themselves through electronically enhanced art. Following step-by-step examples of basic circuitry and programming, even a novice reader will develop the skills necessary to enhance their works. Demonstration projects then give artists a chance to build and program a more efficient light dimmer, randomly flashing LEDs using an integrated circuit, a controlled servo motor, and more. The book even includes art projects to try, include a bouquet of glowing flowers; an LED metronome; a talking computer; Cecil, a sensile robot; and Rover, a simple wheeled robot. A variety of artistic works created by Field's students and based on these open-ended lessons are also included to provide creative sparks for the readers. For those interested in programming their circuits, Field explores the basics of Energia, a free software

package, and provides simple programs to create flashing light patterns, computer controlled motors, and LCD text displays. Simon Field is the author of *Why Is Milk White?*, *Culinary Reactions*, *Why There's Antifreeze in Your Toothpaste*, and *Gonzo Gizmos*, and is the creator of the popular Web site [www.scitoys.com](http://www.scitoys.com).

*Object Lessons* is a series of short, beautifully designed books about the hidden lives of ordinary things. While we all use remote controls, we understand little about their history or their impact on our daily lives. Caetlin Benson-Allot looks back on the remote control's material and cultural history to explain how such an innocuous media accessory has changed the way we occupy our houses, interact with our families, and experience the world.
